Message

I am very pleased to note that Bangladesh Bureau of Statistics (BBS) is going to release the results of the Labour Force Survey (LFS) with quarterly and annual estimates of the key indicators of the labour market for the second consecutive year. The survey is a household-based sample survey and represents another milestone in the statistical system of the country.

The labour force of Bangladesh is that part of the human resources that actually contributes or is available to contribute to the producing goods and providing services in the country. The report presents the annual statistics on the characteristics of labour force, unemployment and the structure of employment at national and divisional level obtained from Quarterly Labour Force Survey.

These statistics provide input for labour market analysis, policy formulation as well as planning, implementing and monitoring programmes related to human resource development. These statistics are essential for monitoring employment and labour market developments in the country. I hope that the report will be useful to all data users, particularly planners and policy makers.

I like to extend my deep appreciation to all concerned of the Bangladesh Bureau of Statistics for their hard work in the quarterly labour force survey activities.

Message

I am pleased to know that the Bangladesh Bureau of Statistics (BBS) continue implementation of the Quarterly Labour Force Survey from July 2015, to generate labour market indicators in a more frequent manner to monitor the labour market situation of the country. This survey is one of the core strategic surveys of BBS.

The report entitled “Labour Force Survey 2016-17, Bangladesh” is presented containing detailed information on the characteristics of the labour force, employment, unemployment, outside labour force, youth employment and unemployment, working hours, occupational injuries and various forms of non-economic activities. The most important aspect of this report is that the report has provided estimates for each quarter separately as well as annual estimates of the key labour market indicators.

Technical assistance from the World Bank is highly acknowledged for developing the complex sampling design. This complex sampling design follows a rotational panel structure and is expected to provide information on the labour market transition over time.

I believe this report will help policy makers, planners and executives of the Government and NGOs for monitoring the change in the labour force and employment situation in the country.

Foreword

The report Labour Force Survey, Bangladesh 2016-17 presents statistics on the characteristics of labour force, unemployment and the structure of employment of the country obtained from Quarterly Labour Force Survey (QLFS) conducted by Bangladesh Bureau of Statistics.

This report provides detailed statistics on labour force, employment, unemployment, non-economic activity, various forms of work, working time statistics, time-related underemployment, labour underutilization, employment in the informal sector and informal employment for monitoring labour market developments in the country. It is hoped that this report meets users' need for comprehensive and up-to-date labour force statistics.

In the past, information on labour force characteristics, employment and unemployment etc. were collected through labour force surveys conducted with the interval of 4-5 years. However, the employment and unemployment data are required at very short intervals to monitor the programs implemented in the employment generating policies of the government. Therefore, to satisfy the need of the time, the BBS initiated the labour force survey on a quarterly basis since July 2015, to measure the levels and trends of employment, unemployment and labour force in the country on a continuous basis.

I would like to express my sincere appreciation to Mr. Md. Amir Hossain, Director General of Bangladesh Bureau of Statistics and Mr. Kabir Uddin Ahmed, Project Director of LMIS Project of BBS for their contributions and hard work.

All suggestions towards improving the future series of this report are highly appreciated.

Preface

Bangladesh Bureau of Statistics (BBS) has initiated the labour force survey on a quarterly basis, to measure the levels and trends of employment, unemployment and labour force in the country on a continuous basis. In the past, labour force surveys conducted at four-five yearly time intervals since 1980. The report Labour Force Survey 2016-17 presents annual estimates as well as quarterly estimates of labour statistics and key indicators of the labour market of the country for the survey period July 2016 to June 2017.

Detailed information on labour force characteristics has been collected from representative sample of 123 thousand households to produce gender disaggregated national and divisional level estimates with urban/rural/city corporation breakdown. The Survey also provides quarterly representative results and sample size for each quarter was 30,816 households. The Survey, along with the quantification of core variables, also estimates important attributes of literacy, migration, own use production of goods and own use provision of services, volunteer work, occupational safety and health etc.

The estimates are profiled according to latest classifications viz Bangladesh Standard Industrial Classification (BSIC 2009 based on ISIC rev-4) and Bangladesh Standard Classification of Occupations (BSCO- 2012 in line with ISCO-2008).

I would like to extend my sincere thanks to the World Bank, Mr. Kabir Uddin Ahmed, Project Director, LMIS Project, Core team members, members of the Technical Committee and Working Group who worked hard for preparing the report. The response rate throughout the survey is quite encouraging and I would like to thank those who responded to the survey, without their cooperation this survey would not be a success.

I hope the data published in this report will be useful to the planners, policy makers, researchers and other stakeholders to formulate evidence based policy for the development of the labour market in the country. Suggestions and comments will highly be appreciated for future improvement of the labour statistics in Bangladesh.

Bangladesh, Bhutan and Nepal
The World Bank

Message

The Labour Force Survey is a very important initiative that the Bangladesh Bureau of Statistics (BBS) has undertaken since 1980. With technical assistance from the World Bank, BBS initiated its quarterly collection of labour market data in 2015/16. This shift in the frequency of labour market data collection from every five years to every quarter was an important milestone reached as part of the National Strategy for the Development of Statistics (NSDS).

The Quarterly Labour Force Survey (QLFS) 2016/17 continues to make important contribution to the collection and dissemination of labour force data, providing critical and up-to-date inputs for a wide range of policy level work, including labour policies and programmes for employment generation. The QLFS report presents quarterly labour statistics over 2016/17 on household and population characteristics, and education and training. It also provides details of economic activities including those in the informal sector with key focus on youth, unemployment, earnings, working hours, quality of employment and social security, working conditions and so on.

The report describes various labour market outcomes in comparison with previous results where possible, to present trends in key indicators. The report also highlights the spatial, gender and age dimensions, which are useful to understand the diverse opportunities and challenges faced by different populations, and their changes over time.

Thus, the report provides valuable information to better understand the labour market conditions in Bangladesh.

Undertaking nationwide data collection on labour statistics every three months is a major accomplishment for BBS. I would like to commend BBS for this effort, and offer congratulations to the Statistics and Informatics Division and BBS for their second QLFS annual report. I look forward to continuing our collaboration with BBS to support further strengthening of its capacity for quality data collection and to conduct policy-relevant analyses.

Acknowledgements

First of all, I would like to express my profound regards and deep sense of gratitude to the Secretary, Statistics and Informatics Division (SID) and the Director General, Bangladesh Bureau of Statistics (BBS) who have suggested numerous improvements to the Labour Force Survey 2016-17 with quarterly estimates. Their experience of varying backgrounds, interest in and knowledge of the subject, helped to shape the text and numbers into its final form. The LFS 2016-17 report is the second of its kind to release quarterly estimates of LMI indicators. The first ever Quarterly LFS report was released in May 2017.

Special thanks to the members of the Technical Committee and the Project Implementation Committee for their valuable inputs and guidelines in proper implementation of the survey. Mr. Md. Akther Hossain, Deputy Director, Mr. Lizen Shah Nayeem, Deputy Director, Mr. Salim Sarkar, Deputy Director, Ms. Salwa Akther, Statistical Officer and Mr. Abu Naser, Statistical Investigator deserve commendable thanks who worked hard with me in analyzing complex survey data. I owe a great debt to the members of the editorial committee of BBS and SID who edited the manuscript to finalize the report. I am very grateful to the stakeholders who have provided their comments and suggestions for the improvement of the report.

Mr. Juan Munoz and Mr. Ramiro, short-term International Consultants of the World Bank, deserve special thanks for developing the complex rotational panel sample design and their technical inputs throughout.

Despite extending every effort to bring an error-free text and numbers, to overcome the first ever challenges of quarterly estimates, some errors may find their way into the survey report. We will be grateful to the users to send their comments or suggestions to improve this report in the future.

Executive Summary

Source of Labour Statistics:

The Labour Force Survey (LFS) is the prime source of labour statistics, world of work and up-to-date labour market information in Bangladesh. It promotes measuring national progress towards the SDG targets “Full and productive employment and decent work” for all.

Bangladesh Bureau of Statistics (BBS) has been conducting the first ever Quarterly Labour Force Survey since July 2015 under a development project. This was a transition of BBS from periodic LFS to quarterly survey. BBS continue its journey in releasing quarterly estimates and Labour Force Survey (LFS) 2016-17 is the second release of its kind. The survey on labour force collected information on various aspects of people’s economic activity and provided labour market statistics relating to employment, unemployment and underemployment and many other aspects of people’s working lives at the national and divisional level with urban and rural breakdown.

Labour force:

The labour force is the sum of persons in employment plus persons in unemployment. Together, these two groups of the population represent the current supply of labour for the production of goods and services taking place.

During the survey period the country’s total estimated population was 161.3 million, of which 80.3 million were female. According to the findings, about 109.1 million persons, representing 67.6 per cent of population, were aged 15 or older, of whom 55.0 million (50.4 per cent) were female. The total population aged 15 or older living in urban areas reached 32.0 million (70.7 per cent). In rural areas, the total population aged 15 or older was 77.1 million (29.3 per cent).

Labour force participation rate (LFPR):

The LFPR is a measure of the proportion of a country’s working-age population that engages actively in the labour market, either by working or by looking for work. It plays a central role in the study of the factors that determines the size and composition of future supply of labour.

The survey findings place the labour force participation rate of the population aged 15 or older at 58.2 per cent, at 80.5 per cent male and 36.3 per cent for females. The participation rate of the population aged 15 or older by area was slightly higher in rural areas (59.3 per cent) than in urban areas (55.7 per cent), leaving 41.8 per cent of the population aged 15 or older outside the labour force.

Employment:

Employed comprises all persons older than 15 years who, during a specified period (7 days prior to the survey) was involved at least for 1 hour, in any form of work for wage or salary, profit or family gain and including the production of goods for own consumption. Gender gap persists in the characteristics of the employment, status in employment, under-utilization, with women generally worse than men.

An estimated 60.8 million of the population aged 15 or older was employed. By occupation, skilled agriculture workers accounted for the largest share of the total employed population, at 32.4 per cent. About 17.2 per cent employed in elementary occupations, followed by 17.0 per cent were employed in craft and related trades workers, 16.5 per cent in Service and Sales workers, 6.8 per cent in Plant and Machine Operators, and Assemblers.

By industry, the largest proportion of the employed population was engaged in agriculture, at 40.6 per cent, followed by 14.4 in manufacturing, and 14.2 per cent in wholesale and retail trade. By main industrial sector, agriculture employed 40.6 per cent of the employed persons, followed by service, at 39.0 per cent, with the smallest proportion in the industry sector, at 20.4 per cent.

One third (31.9 per cent) of the employed population had not had any formal education. More than 15.7 million employed workers (25.8 per cent) had completed some or primary education, while more than 18.7 million workers (30.8 per cent) had completed secondary education.

Informal employment:

The informal economy plays a major role in employment creation, income generation and production in many countries. In countries with high rates of population growth or urbanization, the informal economy tends to absorb most of the growth in the labour force.

The survey found about 85.1 per cent of the total employed persons aged 15 or older in informal employment, while only 14.9 per cent were in formal employment; According to the findings, informal employment incidence was highest in Agriculture sector (95.4 per cent of the total employment in that sector), Industry sector (89.9 per cent of total employment in that sector) and service sector (71.8 per cent of total employment in that sector). The findings also show with no level of education, a large number of employed persons in the informal employment at 94.4 per cent and only at 5.6 per cent in the formal employment. By age group, 89.2 per cent of the youths aged 15-29 engaged in the informal employment, and it is 83.0 per cent of the adults aged 30-64 in the informal employment.

In rural areas, 88.0 per cent of the employed are in informal sector employment whereas it was 77.3 per cent in urban areas. In rural areas, 93.3 per cent of the females are in informal sector employment whereas it was 87.4 per cent in urban areas. At the national level, only 8.2 per cent females engaged in formal employment and it was 17.9 per cent for the male counterparts.

Unemployment rate (UR):

The unemployment rate tells us the proportion of the labour force that does not have a job, is available to work and is actively looking for work. The UR signals to some extent the underutilization of the labour supply

The survey found an estimated 2.7 million persons aged 15 or older who were unemployed. By sex, the number of unemployed males was 1.4 million, compared with 1.3 million unemployed females. A total of 0.9 million persons in urban areas and 1.8 million persons in rural areas were unemployed. The survey findings place the unemployment rate at 4.2 per cent, which was 3.1 for males and 6.7 for females. By area, more urban-based persons were unemployed, at 4.9 per cent, than rural-based persons, at 4.0 per cent.

Youth labour force:

Youth unemployment is an important policy issue for many countries at all stages of development. For the purpose of this indicator, the term "youth" covers persons aged 15-29. Young adults are increasingly attaining secondary and tertiary education in comparison with previous generations.

More than 20.1 million youth aged 15-29 participated in the labour force, with a number of male (13.1 million) and female (7.0 million) youth among them. Their proportion within the total labour force represented 31.6 per cent. The youth labour force proportion was higher in urban areas, at 34.5 per cent, than in the rural areas, at 30.5 per cent. An estimated 17.9 million of them (29.5 per cent of total employed) were employed, with large difference in numbers between male youth (at 12.0 million) and female youth (at 5.9 million). A total of 2.1 million of them (79.6 per cent of total unemployed) were unemployed, with almost same in numbers between male youth (at 1.1 million) and female youth (at 1.1 million).

Status in employment:

Indicators of status in employment distinguish between the two main categories of the employed: (1) employees and (2) the self-employed. Categorization by employment status can help in understanding both the dynamics of the labour market and the level of development.

The largest share of the employed population (44.3 per cent) worked as own-account workers, followed by (39.1 per cent) as employees and contributing family workers (11.5 per cent). Between the sexes by largest share, there were more males in all categories except among contributing family workers, where there were more than three times employed females (5.3 million) than employed males (1.7 million).

Time-related underemployment:

Time-related underemployment (TRU) exists when the hours of work of an employed person are insufficient in relation to an alternative employment situation in which the person is willing and available to engage.

Of all employed persons who worked less than 40 hours in a week in the country in 2016-17, an estimated 1.5 million employed persons (2.4 per cent) were looking for new/additional jobs. Among the underemployed persons, 0.9 million were employed male (2.2 per cent) and 0.5 were employed female (2.9 per cent). And the majority of them lived in rural areas, at 1.2 million persons (2.6 per cent), compared with 0.3 million persons (1.9 per cent) in urban areas.

Earnings from employment:

The concept of earnings for work relates to amounts of money in cash or its equivalent (if payment is in kind) that is received by persons during a period of time as a result of their participation in economic activities. The survey covers income related to paid employment, is the most comprehensive measure of the level of remuneration of workers in paid employment.

The survey findings show that of the estimated 24.2 million paid employees, 56.7 per cent were paid on monthly basis, 34.5 per cent on daily basis, 7.3 per cent on weekly basis and only 1.5 per cent on some other basis. The reported average monthly earnings of paid employees were Taka 13,258. The average monthly earnings for male paid employees was Taka 13,583, which was slightly higher than what the female paid employees earned, at Taka 12,254. Gender wage gap exists in the country and in some occupations, such as craft and related trade workers, elementary occupations and agriculture workers, the difference in earnings between the sexes and rural-urban was wider.

In urban areas, managers earned the highest average monthly earnings among the occupational groups, at Taka 35,734, followed by professionals, at Tk. 26278. In rural areas, managers earned the highest average monthly earnings, at Tk. 25,117, followed by other occupations, at Tk. 24361.

Hours worked per week:

The number of hours worked has an impact on the health and well-being of workers as well as on levels of productivity and labour costs of establishments.

The average hours worked per week was 48 hours, with male workers reporting longer hours of work per week, at 52 hours, then their counterpart female, at 38 hours per week. The average working hours per week were fewer in rural areas (46 hours) than in urban areas (53 hours). Both sexes in the urban areas worked more hours than in the rural areas. By industry the highest average of hours worked per week was for Transportation and Accommodation and food service activities (58 hours), followed by Wholesale and retail trade sector (57 hours), Manufacturing at 55 hours per week on average.

The survey found that around half (49.8 per cent) of the 30.3 million employed persons worked more than 48 hours per week. By sex, the proportion of male workers working more than 48 hours (63.5 per cent) was much higher than that of female workers (18.7 per cent).

Underutilization:

Labour underutilization refers to mismatches between labour supply and demand, which translate into an unmet need for employment among the population.

It is evident from the survey that the number of females were more underutilized, both in rural and urban areas. By largest share, there were a total of 6.6 million working age population was underutilized, more females, (3.5 million or) than males (3.1 million) of the working age population. The underutilized population decreased from 7.1 million in 2015-16 to 6.6 million in 2016-17.

Employment by sector:

This indicator disaggregates employment into three broad sectors – agriculture, industry and services. Sectoral employment flows are an important factor in the analysis of productivity trends, because within-sector productivity growth needs to be distinguished from growth resulting from shifts from lower to higher productivity sectors.

In terms of the distribution of the employed population by broad economic sector, the largest proportion was in agriculture, at 40.6 per cent, followed by 39.0 percent in services and 20.4 per cent in industry sector.

In rural areas, the largest proportion was in agriculture, at 51.7 per cent, followed by 31.3 percent in services and 17.0 per cent in industry sector. More than half (58.8 per cent) employed persons worked in the service sector in urban areas while agriculture is more prominent in rural areas (51.7 per cent)

NEET:

The percentage of the population of 15-29 age group and sex who is not employed and not involved in further education or training. Because they are neither improving their future employability through investment in skills nor gaining experience through employment, NEETs may be particularly at risk of both labour market and social exclusion.

Overall, 29.8 per cent of the working age population aged 15-29 were not in education, employment or training (NEET). Among the NEET youths, 13.0 per cent of them were male and the rest 87.0 per cent female.

A high NEET proportion for young women suggests their engagement in household chores, and/or the presence of institutional barriers limiting female participation in labour markets.

Equal opportunities:

Equality provide tools to eliminate dis-crimination in all aspects of the workplace and in society as a whole. They also provide the basis upon which gender mainstreaming strategies can be applied in the field of labour.

According to the survey findings, the largest share of female employment was in services and sales (30.3 per cent), followed by skilled agriculture work (23.6 per cent), elementary occupations (14 per cent) and machine operations (13 .9 per cent).

The majority of persons reporting any occupational injury or illness said they lost one day (25.8 per cent), followed by those reporting a loss of two days (18.8 per cent). The average number of working days lost due to a work-related injury or illness was 2.2 days.

Safety of work:

Occupational safety and health provide essential tools for governments, employers, and workers to establish such practices and to provide for maximum safety at work.

The larger proportions in cited exposure to dangerous tools (6.9 per cent), followed by Chemicals/explosives (4.0 per cent), Dust, fumes, noise or vibration (4.0 per cent).

Vulnerable employment:

The sum of the employment status groups of own-account workers and contributing family workers. They are less likely to have formal work arrangements, and are therefore more likely to lack decent working conditions. It is often characterized by inadequate earnings, low productivity and difficult conditions of work.

An estimated 55.8 per cent of all employed persons in 2016-17 were own-account or contributing family workers (in vulnerable employment). Almost half of the employed males (50.1 per cent) and nearly seven of every ten employed females (67.7 per cent) were in vulnerable employment.

Chapter 1

Introduction

Bangladesh 2016-17

This chapter described the background and objectives of the labour force survey (LFS). Specific subpopulations are generally of more interest to policy-makers than the whole population. That's why a brief of statistical classifications, such as Industry and occupation, age, sex, marital status, status in employment, education and labour force status is described in this chapter that is used for generating the key indicators of labour market.

Chapter 1

Introduction

1.1 Background

Bangladesh continues to grow and integrate further with the global economy, and that's why the access to decent and productive work remains one of the most viable means of poverty reduction. Despite of major achievements, there are lingering and emerging policy challenges confronting the country that will influence the achievement of its decent work goals. As the working-age population expands in the coming years, the pressure on the labour market to provide quality jobs will also rise. Addressing deficits in both the quantity and quality of jobs therefore remains a major policy challenge for Bangladesh. In general, several noteworthy trends emerged from the past decade in labour market - growth reduced poverty rates, even though unemployment rates are low and falling. This raises concerns about the quality of jobs, especially with such a large proportion of workers in vulnerable employment. The projected population trends indicate a rise in the adult working-age population, which is likely to add to the challenge of creating decent work opportunities for an expanding labour force.

Bangladesh Bureau of Statistics (BBS), the National Statistical Organization (NSO) of the country, has been conducting Labour Force Survey (LFS) since 1980 and continue it every three/four year until 2013. BBS has started implementation of quarterly labour force survey (LFS) to provide labour market indicators from July 2015 under a development project. The LFS 2016-17 report is the second annual report with quarterly breakdown of the estimates. Gender disaggregated data on labour force, employment, unemployment, underemployment, not in labour force, hours worked, earnings, informal employment, non-economic activities, volunteer activities are available in this report. Relevant sex and age-specific labour market information is provided in this report for informed decision-making and setting up an effective labour market information system. Additional efforts are taken to boost the information base and to achieve more robust and detailed labour and social trends analysis and monitoring, which will in turn provide a more credible basis for labour market policy formulation.

The survey report has provided a complete picture of labour statistics as well as the following key Indicators of labour market:

- Labour force participation rate
- Employment-to-population ratio
- Status in employment
- Employment by sector
- Employment by occupation
- Hours of work
- Employment in the informal economy
- Unemployment and youth unemployment
- Not in labour force
- Educational attainment
- Average monthly wages

1.2 Objectives of the survey

The primary objective of the survey was to collect comprehensive data on the labour force, employment and unemployment of the population aged 15 or older for use by the Government, international organizations, NGOs, researchers and others to efficiently provide targeted interventions. Specific objectives of the survey:

- Provide relevant information regarding the characteristics of the population and household that relate to housing, household size, female-headed households etc.
- Provide detailed information on education and training, such as literacy, educational attainment and vocational training.
- Provide relevant information on economic activities and the labour force regarding the working-age population, economic activity status and labour force participation.
- Provide detailed information on employment and informal employment by occupation and industry, education level and status in employment.
- Provide relevant information on unemployment, the youth labour force participation, youth employment, and youth unemployment.
- Provide other information on decent work regarding earnings from employment, working hours and time-related underemployment, quality and stability of employment, social security coverage, and safety at work, equal opportunities etc.
- Provide relevant information on non-economic activities, volunteer activities etc.

1.3 Classifications used for labour statistics

Specific subpopulations are generally of more interest to policy-makers than the whole population. Classifications of units are therefore generally part of a statistical framework. It is unlikely that small subpopulations will be sufficiently well represented in a sample survey to enable reliable estimates. It will therefore be difficult to obtain indicators for these subpopulations from sample surveys unless they are specifically designed to cover them. Classifications of labour statistics are made in this report based on sex, age, highest education level attained, labour force status and occupation and industry.

Age coverage:

Age is a strong determinant of labour market so a common age cut-off and categories are important. The labour related questions of the survey refer to the population of 15 years old and over. The following age ranges is used in presenting the statistics: 15–24; 25–34; 35–44; 45–54; 55–64; and 65 and over. Besides, LMI is provided separately for youths as the youths are more prone to unstable transition to labour market.

However, in setting the minimum LFS coverage age is the fact that the Government of Bangladesh, being aware that many young people, who are unable to continue with higher schooling, enter the labour market instead, has set the legal age for admission to employment at 14 completed years. Given that, inclusion of persons aged 15 years and over may result in the undercount of persons employed or unemployed in the country.

Sex:

Sex (male or female) of every individual is recorded, as sex disaggregation of data is a fundamental requirement for gender statistics and in particular for the analysis of the gender gap in the access to the labour market. For policy purposes, all core indicators are broken down by sex, in order to maximize information on any gender gap.

Education classification:

Refers to persons who have never attended school in any of the educational institutions that provide formal education. Education classification used to match the following aggregated level is used:

- None and never attended school
- Primary
- Secondary
- Higher Secondary
- Tertiary
- Others (don't know level completed)
- Refers to the highest level in which a person has completed schooling or is currently attending, in a public or private educational institution that provides formal education

Marital status:

Unmarried/Never married

Refers to those who have never been married at the time of interview.

Married

Refers to persons who are currently married at the time of interview. The term, 'married' includes those married by law or by religious rites.

Widowed

Refers to those who have not remarried after the death of the spouses at the time of interview.

Divorced/ separated

Refers to those whose marriages were annulled through divorce by law or religious arrangement or separated for a long duration without any possibility of reconciliation.

Labour force status:

Categories for labour force status used to break down labour market indicators at the individual level are based on the following categories:

- Employed
- Unemployed
- Not in the labour force.

Occupation classifications:

Bangladesh Bureau of Statistics (BBS) developed the Bangladesh Standard Classification of Occupations 2012 (BSCO-2012) on International Standard Classification of Occupations (ISCO-08) as the national occupational classification code guide for national use and international comparability. The indicator for employment by occupation comprises statistics on jobs classified according to major groups as defined in the Bangladesh Standard Classification of Occupations (BSCO). The most recent version of the Bangladesh Standard classification of Occupations, distinguishes the following 10 major groups:

- (1) Managers;
- (2) Professionals;
- (3) Technicians and associate professionals;
- (4) Clerical support workers;
- (5) Service and sales workers;
- (6) Skilled Agricultural, Forestry and Fisheries workers;
- (7) Craft and related trade workers;
- (8) Plant and machine operators and assemblers;
- (9) Elementary occupations; and
- (10) Others occupations.

Industry classification of economic activities:

Bangladesh Standard Industrial Classification (BSIC) is used for classifying all economic activities. The Bangladesh Bureau of Statistics (BBS) has developed BSIC based on International Standard Industrial Classification (ISIC) rev-4 and Bangladesh context for national use and international comparability. The results of the QLFS survey provided information at the section level. The section refers to very broad structure of the economy as well as economic activities such as Agriculture, forestry and fishing which is denoted by an alphabet. The individual categories of BSIC have been divided into 21 sections (A to U).

The indicator for employment by sector divides employment into three broad groupings of economic activity: Agriculture, Industry and Services. Because users may be interested in analyzing trends in employment in greater sectoral detail, detailed break-downs of employment by sector as defined by the Bangladesh Standard Industrial Classification of all Economic Activities (BSIC). The most recent version of the International Standard Industrial Classification, ISIC rev-4, distinguishes 21 major groups as follows:

1. **A** "Agriculture, forestry and fishing "
2. **B** "Mining and quarrying"
3. **C** "Manufacturing"
4. **D** "Electricity, gas, steam and air conditioning supply"
5. **E** "Water supply, sewerage, waste management and remediation activities"
6. **F** "Construction"
7. **G** "Wholesale and retail trade, repair of motor vehicles and motorcycles"
8. **H** "Transportation and storage"
9. **I** "Accommodation and food service activities (Hotel and restaurants)"
10. **J** "Information and communication"
11. **K** "Financial and insurance activities"
12. **L** "Real estate activities"
13. **M** "Professional, scientific and technical activities"
14. **N** "Administrative and support service activities"
15. **O** "Public administration and defense, compulsory social security"
16. **P** "Education"
17. **Q** "Human health and social work activities"
18. **R** "Arts, entertainment and recreation"
19. **S** "Other service activities"
20. **T** "Activities of households as employers, undifferentiated goods and services producing activities of households for own use services-producing activities of households for own use"
21. **U** "Activities of extraterritorial organizations and bodies"

Chapter 2

Survey methodology

Bangladesh 2016-17

This chapter describes the methodology used in the survey. It explains the scope and coverage of the survey, frame, sample size determination, sampling design, estimation procedure, field operations, data processing, questionnaire and a brief of concepts and definitions.

Chapter 2

Survey methodology

This chapter describes the methodology used in the Labour Force Survey. It explains the scope and coverage of the survey, sampling design, concepts and definitions, field operations, data processing and limitations.

2.1 Scope and coverage

The Labour Force Survey 2016-17 was conducted Quarterly to provide reliable estimates of the labour force population at the geographic division level with rural-urban breakdown. The labour force component covered the population aged 15 or older living in the sample households to obtain estimates on many variables, particularly in relation to the economic and non-economic activities of the population aged 15 or older in the labour force. The survey involved a sample of 30816 households from 1284 PSUs/sample enumeration areas distributed across all the 64 Districts for each quarter and the ultimate sample households for the year 2016-17 was 123000 in total. The survey covered both urban and rural areas and dwelling households, including one-person households. The institutional households, that is, those living in hostels, hotels, hospitals, old homes, military and police barracks, prisons, welfare homes and other institutions were excluded from the coverage of the survey.

2.2 Survey organization

Bangladesh Bureau of Statistics (BBS), the NSO of Bangladesh served as the implementing agency and as such played a primary role in the planning, survey execution and analysis, and report preparation. As the implementing agency, the Bureau undertook the responsibilities for operational matters; including planning and conducting fieldwork and processing of collected data and finally prepares the report. The day-to-day technical operations of the survey including identification and training of field and data processing staffs, and the supervision of the office and field operations were fully undertaken under the supervision of BBS and Statistics and Informatics Division (SID). The World Bank has contributed a lot in developing the sample design for the first ever Rotational Panel Sample Design and development of the Questionnaire in Bangladesh.

2.3 The sample frame

The frame used for the selection of sample for the survey was based on the Population and Housing Census 2011. Sampling Frame which was made up of preparing of PSUs that is consists of collapsing one or more Enumeration Area (EAs) that was created for the Population and Housing Census 2011. EAs is geographical contiguous areas of land with identifiable boundaries. On average, each PSUs has 225 households. All the Enumeration areas of the country was identified into three segments viz. Strong, Semi-strong and not-strong based on the housing materials. The frame has 1284 PSUs/EAs spread all over the country, and covers all socio-economic classes and hence able to get a suitable and representative sample of the population. The survey was distributed into twenty-one domains viz. Rural, Urban and City corporations of seven administrative divisions.

From each selected PSUs/EAs, an equal number of 24 households were selected systematically, with a random start. The systematic sampling method was adopted as it enables the distribution of the sample across the cluster evenly and yields good estimates for the population parameters. Selection of the households was done at the HQ and assigned to the Enumerators, with strictly no allowance for replacement of non-responding households.

The Bangladesh Quarterly Labor Force Survey (QLFS) sample will be selected in two stages, with small area units called Primary Sampling Units (PSUs) in the first stage and a cluster of 24 households per PSU in the second stage. Both stages are random selections. The survey will implement a rotational panel strategy, in which some of the households in each cluster will be replaced by new households each quarter.

The survey administered with a total sample about 123 thousand households, intended to deliver reliable quarterly estimates of unemployment and other relevant labor force indicators for of the country's seven divisions and locality viz. national level estimates with disaggregation by City Corporations, Rural and Urban.

2.4 Sample size determination

The number of households' n needed to estimate an individual-level prevalence P with a margin of error E at the confidence level α is given by

$$n = \frac{Deff}{c} \frac{t_{\alpha}^2 P(1 - P)}{E^2}$$

where $Deff$ is the design effect, due to stratification and clustering, c is the average number of relevant individuals per household, and t_{α} is the normal deviate corresponding to the confidence level α .

The earlier LFS 2013 reported an unemployment rate of 4.2%, with a design effect of 1.77 and an average of 1.92 persons in the labor force per household. Using these figures as referential parameters, the number of households needed to estimate this indicator with a margin of error of 1% at the 95% confidence level is

$$n = \frac{1.77 (1.96)^2 * 0.042 * (1 - 0.042)}{1.92 (0.01)^2} \approx 1,400$$

which implies that a total sample of around 29,400 households would be needed to achieve the required precision in all 21 estimation domains. Since these domains have very unequal populations – ranging from less than half a million in the smaller city corporations to nearly 30 million in rural Dhaka – the distribution of the sample into such domains should arbitrate between doing it equitably (which would deliver estimates of similar precision for all of them) and doing it proportionally (which would deliver nearly optimal estimates for Bangladesh as a whole). Consistently with the criterion used by the BBS for the 2013 QLFS, the new survey will do it on the basis of Kish's allocation, which is generally considered the best compromise between these two extremes: the sample will be thus distributed in proportion to the factors $\sqrt{1/N_h^2 + 1/H^2}$, where H is the number of strata (24 in this case) and N_h ($1 \leq h \leq H$) are the number of households reported by the 2011 census in each domain.

In addition to the above theoretic considerations, the QLFS sampling design needs to account for two practical constrains imposed by fieldwork management:

- First, the total sample size obviously needs to be a multiple of the cluster size (24 households).
- Second, since the survey will be fielded by dedicated interviewers, each responsible for visiting 12 PSUs per quarter (one per week), to make an efficient use of human resources, and to keep all interviewers working within zila boundaries, the number of PSUs per zila should be a multiple of 12.

This in turn implies that, in addition to the ten city corporations, the rural and urban portions of all 64 zilas should become *de facto* sampling strata.

Table 1 below presents the number of households in the country, as per the 2011 Census; the sample size of the QLFS, and the expected margins of error for the quarterly estimation of unemployment by analytic domain. The margin of error for the estimation of quarterly unemployment is expected to be 0.26% for Bangladesh as a whole, and to vary between 0.5% and 1.5% in the targeted analytic domains.¹

Table 1: Number of households, sample sizes and expected margins of error

Divisions and City Corporations		2011 Census			2015 LFS			2015 LFS		
		Number of Households			Sample Size (No. of HHs)			Expected Margin of Error		
		Rural	Urban	City Corps	Rural	Urban	City Corps	Rural	Urban	City Corps
Barisal	Barisal	1,558,121	226,222	70,798	1,080	792	720	1.15%	1.34%	1.41%
Chittagong	Chittagong	4,085,699	764,552	540,849	2,568	1,248	816	0.74%	1.07%	1.04%
	Comilla			187,132			840			
Dhaka	Dhaka	4,085,699	1,653,821	1,468,123	4,320	1,440	1,032	0.57%	0.99%	0.84%
	Gazipur			435,176			888			
	Narayanganj			305,484			672			
Khulna	Khulna	3,065,156	502,523	152,051	2,112	1,056	864	0.82%	1.16%	1.28%
Rajshahi	Rajshahi	3,708,332	666,061	96,718	2,256	1,008	768	0.79%	1.19%	1.36%
Rangpur	Rangpur	3,329,786	414,493	62,415	2,088	936	720	0.83%	1.23%	1.41%
Sylhet	Sylhet	1,507,385	178,417	93,309	1,104	816	672	1.13%	1.32%	1.45%
Total Bangladesh		31,846,908			30,816			0.26%		

In anticipation of its future expansion, the QLFS sample will be selected as a subset of a larger sample of 87,000 households (3,612 PSUs), intended to deliver quarterly zila-level estimates with margins of error of about 1% – ranging from 0.5% (in Dhaka) to 1.3% in the smaller zilas – and national quarterly estimates with a margin of error of 0.13%.

Sample frames

Most BBS household surveys use a two-stage sampling strategy similar to that of the QLFS, and most of them share a common set of PSUs – the Integrated Multi-Purpose Sample (IMPS) – as a basis for their first sampling stage. However, the QLFS, given the specificities of its rotational strategy, has opted for choosing an independent set of PSUs for this purpose.

The first stage sample frame of the QLFS was developed on the basis of the list of Enumeration Areas (EAs) generated by the 2011 Census. Some of the original 293,093 EAs were deemed too small to support the adopted rotational panel strategy, and were joined to neighboring EAs in order to create 146,576 PSUs of more adequate size: most of the resulting PSUs have between 150 and

¹ The errors will be even smaller for annual estimates, as well as for the estimation of quarter-to-quarter differences, but improvements are hard to predict at this moment, without previous experience with panel labor force surveys in Bangladesh.

300 households, with an average of 217. Whenever possible, the EAs with less than 150 households were appended to EAs from the same village, although in the most sparsely populated areas it was sometimes necessary to append entire villages to neighboring villages within the same *mauza* or *mahalla* (the lower level administrative division of the country.)² Entire mauzas or mahallas were never appended to neighboring areas, even if they were too small – they remained as individual PSUs in the sample frame.

The second stage sample frame will be a full listing of all households in the selected PSUs. The listings were completed between February and March 2015. If the survey indeed becomes a regular exercise, they should be permanently updated so that they are never older than two years.

First sampling stage

Using the 24 analytic domains as pre-strata, a nominal sample of 1,200 PSUs was distributed with Kish's allocation, and then imposed the additional constrain of having integer multiples of 12 PSUs in each of the country's 64 zilas, considering that each interviewer is expected to visit 12 PSUs per quarter. This resulted in an effective total sample of 1,284 PSUs, allocated into 138 explicit strata (the 10 city corporations plus the rural and urban portions of each of the country's 64 zilas). It will mobilize 107 interviewers.

Within each stratum, the sample was selected with probability proportional to size (*PPS*), using as a measure of size the number of households reported by the 2011 census, and with implicit stratification by socio-economic level³ in city corporations, followed by the lower administrative subdivisions (upazila / thana, union / ward, and mauza / mahalla, in this order) in all strata.⁴ The EAs previously selected by the BBS for its Integrated Multi-Purpose Sample (IMPS) were not excluded from this selection.

Outsized PSUs

Very few of the small mauzas or mahallas that remained as individual PSUs in the sample frame after the EA aggregation process were actually selected as PSUs for the QLFS. They were appended to neighboring PSUs using a carefully conceived and well documented rule, to ensure that the selection probabilities of the aggregates can be calculated unambiguously.

102 of the 1,284 PSUs chosen in the first sampling stage had more than 350 households and were considered too large to be listed entirely. These were segmented whenever possible into smaller units. Since 97 of them had actually resulted from appending EAs smaller than 150 households to neighboring EAs (see Section *Sample Frames* above), this could be done automatically by simply

² Although the census cartography is not geo-referenced, the process of appending EAs to neighboring EAs, and villages to neighboring villages could be conducted automatically, because the census attributed the EA and Village codes based on a *serpentine* pattern. EAs and villages with consecutive numbers could thus be reliably assumed to be territorial neighbors.

³ The dominant building type of the PSU (solid, semi-solid or other) was used for this purpose as proxy for its socio-economic level.

⁴ In practice, the expanded sample of 3,612 PSUs was allocated into strata and selected with *PPS* first, and then the 2015 QLFS sample was selected from it by systematic, equal probability sampling within each stratum. This is formally equivalent to selecting the 2015 QLFS sample with *PPS* directly, and facilitates the calculation of exact selection probabilities.

choosing one of the EAs randomly with *PPS*.⁵ The other five large PSUs were each composed of a single EA and could not be automatically segmented in this way.

Second sampling stage and rotational scheme

All households listed in each PSU will be randomly divided into *blocks*, each composed of 6 households, and the blocks will be labeled with the letters A, B, C, etc. The QLFS will visit 4 blocks (24 households) each quarter, according to the 2-(2)-2 rotational scheme shown below:

- Quarter 01 (July-September 2015): Blocks A B - - E F
- Quarter 02 (October-December 2015): Blocks G B C - - F
- Quarter 03 (January-March 2016): Blocks G H C D - -
- Quarter 04 (April-June 2016): Blocks - H I D E -
- Quarter 05 (July-September 2016): Blocks - - I J E F
- Quarter 06 (October-December 2016): Blocks G - - J K F
- Quarter 07 (January-March 2017): Blocks G H - - K L
- Quarter 08 (April-June 2017): Blocks M H I - - L

In this way, each block will be visited in two consecutive quarters, left to rest for the next two quarters, revisited for another two quarters, and then dropped (perhaps to be reinstated some years later, if the survey runs out of households in the PSU). After the first few quarters of operation, the survey will, at any given time, revisit one half of the households visited the previous quarter, and one half of the households visited in the same season a year before. Apart from its clear analytic benefits, this rotational scheme is intended to substantially improve the precision of quarter-to-quarter and year-to-year variation measurements.⁶

The specific technique used to randomly split the PSU into blocks depends on local circumstances. In most zilas, each block is a systematic, equal-probability sample of all households listed, as shown in the pattern below, where the letters represent the six households in each block:

ABCD.....ABCD.....ABCD.....ABCD.....ABCD.....ABCD.....

However, in Bandarban, Khagrachhari and Rangmati – three hilly districts of the Chittagong division, characterized by the sparse distribution of their population – the blocks are instead cluster samples of the PSU, intended to reduce the travel of the interviewers, as shown in the pattern below:

AAAAAABBBBBBCCCCCDDDDDD.....

The household lists from all 1,284 PSUs have been computerized to facilitate the randomization process and the overall management of the sample. The full database contains information from nearly 300,000 households.

⁵ Although this is in fact an additional sampling stage, it is formally equivalent to considering each of the EAs of the large PSUs as individual PSUs, and it does not require any changes in the formulas for the selection probabilities and sampling weights.

⁶ If the survey were to visit independent samples each quarter, the standard error of the difference between any two quarterly measures would be approximately $\sqrt{2}$ times the error of each measure. For instance, the standard error for the variation of unemployment between two consecutive quarters at the national level would be 0.36% ($1.4 \times 0.26\%$). However, with the rotational scheme adopted by the QLFS, the error will be much smaller (possibly less than 0.10%), as a result of the correlation of the employment status of individuals between quarters.

Estimation – Selection probabilities and sampling weights

With the sampling strategy described here, the probability p_{hij} of selecting household hij in PSU hi of stratum h in any given quarter is given by⁷

$$p_{hij} = \frac{k_h n_{hi}}{\sum_i n_{hi}} \times \frac{m_{hi}}{n'_{hi}}$$

where

- k_h is the number of PSUs selected in stratum h ,
- n_{hi} is the total number of households in PSU hi , as reported by the 2011 Census,
- n'_{hi} is the total number of households in PSU hi , as reported by the QLFS household listing operation, and
- m_{hi} is the number of households visited in PSU hi (normatively always 24).

To obtain unbiased estimators from the sample, the data reported for the household should be affected by a sampling weight (or raising factor) w_{hij} , equal to the inverse of its selection probability ($w_{hij}=1/p_{hij}$). If n_{hi} and n'_{hi} were equal in all PSUs, the formula would simplify to a constant and the sample would be self-weighted within each stratum. In practice, n_{hi} and n'_{hi} will rarely be equal but often similar, so the sample will not be exactly self-weighted, but quite approximately so.

As the quarterly survey started from July 2015, survey base weights were post-adjusted to estimate total population of July 2015 for the first quarter and kept same for the successive three quarters of the QLFS 2015-16. Similarly, survey base weights were post-adjusted to estimate total population of July 2016 for the QLFS 2016-17. However, post-adjusted survey base weights to estimate total population of January 2017 for the QLFS 2016-17 is also available in the microdata.

2.5 Data collection

To aid in identification and access to the household, letters of introduction highlighting survey objectives and identification badges were provided to the Enumerators. Enumerators were advised to visit the households to introduce themselves prior to administer the Questionnaire. Supervising officer also sometimes went for courtesy calls to the Households. It took the Enumerators approximately 30-40 minutes to administer the questionnaire depending on the size of the household. Most of the teams managed to collect the data within the stipulated timeframe. Data collection was carried out using personal interview approach. Officers from BBS and outsourcing Enumerators who were involved in this survey were given special training. They visited selected households (HH) to collect information on demography, labour force, non-economic activities using a set of questionnaires. Field checks were undertaken by experienced officers from the BBS & SID to detect and rectify any invalid information occurred during interview session. In addition, follow-up/re-interviews of certain selected households was done to ensure the quality of data collected.

⁷ The two factors on the right-hand side of the equation represent the probability of selecting the PSU, and the conditional probability of selecting the household in the PSU.

2.6 Data processing

Initial manual editing and coding of industry and occupation classification was done in the BBS headquarters by the selected editors and coders. The supervising officers further checked the questionnaires and validated the data randomly sampled edited questionnaires. Data was captured using Census and Survey Processing System (CSPro) through a data entry screen specially created and incorporated with checks to ensure accuracy during data entry. Erroneous entries and potential outliers were then verified and corrected appropriately. A total of 12 data entry personnel were engaged during the exercise. Weights were developed to account for the selection probabilities. The weights were developed using the design weights of the PSUs. The non-response adjustment and urban-rural calibration was also used. The captured data were exported to STATA format for cleaning and analysis. The cleaned data was weighted before final analysis.

2.7 Training of survey personnel

To properly conduct the nationwide survey, intensive training programmes were arranged for the survey supervisors and enumerators as well as the survey coordinators. In total, 107 enumerators, among them 94 females and 84 supervising officers, were involved and received seven days of training on data collection. The training consisted of five days for training, one day for field testing and one day for reviewing. The training covered instructions in general interviewing techniques, field procedures (including sample selection), a detailed discussion of items on the questionnaire and practice interviews in the field.

2.8 Questionnaire

The Quarterly Labour Force Survey 2015-16 questionnaire comprised 14 sections, as follows:

- Section 1. Household basic information
- Section 2. Household roster (members' basic information)
- Section 3. General education (for persons aged 5 years or older) & vocational training (for persons aged 15 years or older)
- Section 4. Working status (for persons aged 15 years or older)
- Section 5. Main activities (for persons aged 15 years or older)
- Section 6. Secondary activities (for employed persons aged 15 years or older)
- Section 7. Occupational safety and health within the previous 12 months (for persons aged 15 years or older)
- Section 8. Underemployment (for employed persons aged 15 years or older)
- Section 9. Unemployment (for not employed persons aged 15 years or older)
- Section 10. Own use production of goods (for persons aged 15 years or older)
- Section 11. Own use provision of services (for persons aged 15 years or older)
- Section 12. Unpaid trainee/apprentice work (for persons aged 15 years or older)
- Section 13. Volunteer work (for persons aged 15 years or older)
- Section 14. Migration (for persons aged 15 years or older)

**The survey questionnaire is included in Annex III.

2.9 Concepts and definitions

Household

A “household” is defined as a person or group of persons who live together in the same house or compound who share the same housekeeping arrangements and who are catered for as one unit. Members of a household are not necessarily related to each other, either by blood or marriage. Conversely, members who live together in the same house or compound and are related by blood or marriage do not necessarily belong to the same household. To be considered a household member, an individual must reside with the other household members in the dwelling for a substantial part of the year (e.g., six-month criterion) and must not be a member of any other household.

Labour force participation rate

The labour force participation rate is a measure of the proportion of a country’s working-age population that engages actively in the labour market, either by working or looking for work. It provides an indication of the size of the supply of labour available to engage in the production of goods and services, relative to the population at working age. The breakdown of the labour force by sex and age group gives a profile of the distribution of the economically active population within a country.

The working-age population is the population above the legal working age – often aged 15 and older. The labour force participation rate is defined as the ratio of the labour force to the working-age population, expressed as a percentage. The labour force is the sum of the number of persons employed and the number of persons unemployed. Thus, the measurement of the labour force participation rate requires the measurement of both employment and unemployment.

The labour force participation rate is related by definition to other indicators of the labour market. The inactivity rate is equal to 100 minus the labour force participation rate, when the participation rate is expressed as a number between 0 and 100.

The labour force participation rate indicator plays a central role in the study of the factors that determine the size and composition of a country’s human resources and in making projections of the future supply of labour. The information is also used to formulate employment policies, to determine training needs and to calculate the expected working lives of the male and female populations and the rates of accession to, and retirement from, economic activity – crucial information for the financial planning of social security systems.

The indicator is also used for understanding the labour market behavior of different categories of the population. The level and pattern of labour force participation depends on employment opportunities and the demand for income, which may differ from one category of persons to another.

Economic activity

The concept of “economic activity” adopted by the thirteenth International Conference of Labour Statisticians (13th ICLS) in 1982 for measuring the economically active population is defined in terms of the production of goods and services as set forth by the System of National Accounts (SNA). The 13th ICLS Resolution specifies that “the economically active population comprises all persons of either sex who furnish the supply of labour for the production of economic goods and services, as defined by the United Nations system of national accounts, during a specified time-reference period.” Thus, persons are to be considered economically active if, and only if, they contribute to or are available to contribute to the production of goods and services falling within the SNA production boundary. The use of a definition of economic activity based on the SNA serves to ensure that the concepts used in employment and production statistics are consistent, thus facilitating the joint analysis of the two bodies of data.

Labour Force

Current economic activity is measured in relation to a short reference period (generally one week). The economically active population includes both employed and unemployed persons. The currently active population is also known as the “Labour Force”. The economically active population comprises all persons of either sex who supply their labour for the production of goods and services during a specified time reference period. According to the 1993 version of the System of National Accounts, production includes all individual or collective goods or services that are supplied to units other than their producers, or intended to be so supplied, including the production of goods or services used in the process of producing such goods or services; the production of all goods that are retained by their producers for their own final use; the production of housing services by owner-occupiers and of domestic and personal services produced by paid domestic staff. “Labour force” refers to persons 15 years or older who contribute or are available to contribute to the production of goods and services in the country. They are either employed or unemployed during the reference week prior to the survey.

Current economic activity

The word “current” means during the week prior to a survey or the most recent week. This is sometimes also called the “reference week”. Thus, if an interview takes place on a Wednesday, the reference week will start from Tuesday the previous day and work backwards seven days. Because a survey is spread over several weeks, the reference week may be different for different households, depending on when they are interviewed. It is therefore essential that each informant clearly understands the seven-day reference period to which the “past week” refers. Current economic activities were covered in the questionnaire sections on current activity, characteristics of the main job or activity, characteristics of the secondary job or activity, hours of work, underemployment and job search.

Employment by occupation

The indicator for employment by occupation comprises statistics on jobs classified according to major groups as defined in the Bangladesh Standard Classification of Occupations (BSCO). The most recent version of the International Standard of Occupation, ISCO-08, distinguishes 10 major groups: (1) Managers; (2) Professionals; (3) Technicians and associate professionals; (4) Clerical support workers; (5) Service and sales workers; (6) Skilled Agricultural, Forestry and Fisheries workers; (7) Craft and related trade workers; (8) Plant and machine operators and assemblers; (9) Elementary occupations; and (10) Others occupations.

Employment

The ILO definition of employment provides separate criteria for persons in paid employment and persons in self-employment in order to accommodate the idea that employment covers any work, be it for wage or salary, profit or family gain and including the production of goods for own consumption. The "employed" comprises all persons older than a specified age who, during a specified brief period, either one week, were in one of the following categories:

(a) paid employment

- i. at work – persons who during the reference period performed some work for wage or salary, in cash or in kind;
- ii. with a job but not at work – persons who, having already worked in their present job, were temporarily not at work during the reference period but had a formal attachment to their job.

(b) self-employment

- i. at work – persons who during the reference period performed some work for profit or family gain, in cash or in kind;
- ii. with an enterprise but not at work – persons working with an enterprise, which may be a business enterprise, a farm or a service undertaking, who were temporarily not at work during the reference period for any specific reason.

For operational purposes, the notion "some work" may be interpreted as work for at least one hour. Unpaid family workers at work should be considered as in self-employment, irrespective of the number of hours worked during the reference period. Apprentices who receive pay in cash or in kind should be considered in paid employment and classified as "at work" or "not at work" on the same basis as other persons in paid employment. Members of the armed forces should be included among persons in paid employment. They should include both the regular and temporary members.

Unemployment

The international standard definition of unemployment is based on the following three criteria, which should be satisfied simultaneously: "without work", "currently available for work" and "seeking work". The "unemployed" comprise all persons older than a specified age who during the reference period were:

- (a) without work – not in paid employment nor self-employed;
- (b) currently available for work – available for paid employment or self-employment during the reference period (one week); and
- (c) seeking work – had taken specific steps in a specified reference period (one month) to seek paid employment or self-employment.

Youth unemployment

Youth unemployment is widely viewed as an important policy issue for many countries, regardless of their stage of development. For the purpose of this indicator, the term "youth" covers persons aged 15 to 24 years and "adult" refers to persons aged 25 years and over. This report considers the term "youth" covers persons aged 15 to 24 years and "adult" refers to persons aged 25 years and over. Sometimes, the term "youth" covers persons aged 15 to 29 years and "adult" refers to persons aged 30 years and over. The "Department of Youth, Bangladesh" is defined youth as persons aged 18 to 35 years and some basic statistics is provided in this report for their own use following this age group.

Informal sector

The informal sector consists of unregistered and/or small unincorporated private enterprises engaged in the production of goods or services for sale or barter. The enterprises typically operate on a small scale at a low level of organization, with little or no division between labour and capital as factors of production. Labour relations are based mostly on casual employment, kinship or personal and social relations. An unincorporated enterprise is a production unit that is not constituted as a separate legal entity independently of the individual (or group of individuals) who owns it and for which no complete set of accounts is kept. Employment in the informal sector refers to the total number of jobs in informal sector enterprises. For practical reasons, the concept is measured as the number of persons employed in informal sector enterprises in their main job.

The informal sector represents an important part of the economy, and certainly of the labour market, in many countries and plays a major role in employment creation, production and income generation.

Informal employment

Informal employment, which encompasses all the jobs included in the concept of employment in the informal sector (except those that are classified as formal jobs in informal sector enterprises), refers to those jobs that generally lack basic social or legal protections or employment benefits and may be found in formal sector enterprises, informal sector enterprises or households.

Informal employment is defined as the total number of informal jobs, whether carried out in formal sector enterprises, informal sector enterprises, or households, during a given reference period. Included are:

- Own-account workers (self-employed with no employees) in their own informal sector enterprises;
- Employers (self-employed with employees) in their own informal sector enterprises;
- Contributing family workers, irrespective of type of enterprise;
- Members of informal producers' cooperatives (not established as legal entities);
- Employees holding informal jobs as defined according to the employment relationship (in law or in practice, jobs not subject to national labour legislation, income taxation, social protection or entitlement to certain employment benefits (paid annual or sick leave, etc.);
- Own-account workers engaged in production of goods exclusively for own final use by their household.

For operational reasons, the concept is measured as the number of persons employed (and not the number of jobs) in informal employment in their main job. Where they exist, employees holding formal jobs in informal sector enterprises should not be counted as informal employment. The Stata code for identifying the informal employment is provided in the Annex for clarification and regeneration of the statistics of informal employment of the country.

Employees with informal jobs in either a formal or informal sector enterprise or as paid domestic workers in a household are considered to have informal jobs if their employment relationship is, in law or in practice, not subject to national labour legislation, income taxation, social protection or entitlement to certain employment benefits (such as advance notice of dismissal, severance pay or paid annual or sick leave). The statistical definition considers both the job-based concept (the situation of an individual employed person in the job) and the establishment-based concept (the informal character of the establishment). According to the international standards and using the survey questionnaire, the informal employment calculation is based on the institutional sector, establishment registration, status in employment and contribution to pension or retirement fund.

Time-related underemployment

This indicator relates to the number of employed persons whose hours of work in the reference period are insufficient in relation to a more desirable employment situation in which the person is willing and available to engage. The indicator was previously known as “visible underemployment”. Two time-related underemployment rates are presented: one gives the number of persons in time-related underemployment as a percentage of the labour force, and the other as a percentage of total employment.

The measurement of time-related underemployment is considered an integral part of the framework for measuring the labour force. The time-related underemployed includes all employed persons whose working time in all jobs is “insufficient in relation to an alternative employment situation in which the person is willing and available to engage”. The criteria for defining time-related underemployment are:

- i willingness to work additional hours;
 - ii availability to work additional hours and
 - iii having worked (total number of *hours actually worked*) below a threshold (usually 40 hours in a week) of working hours. The threshold of working time has to be determined at the national level in order to identify those who worked a sufficient number of hours and to integrate the labour demand aspect into the indicator.
- The **willingness to work additional hours** is the main criterion and identifies persons who, independently of the number of hours already worked during the reference week in all their jobs, express a desire or preference to work more hours.
 - The **availability to work additional hours** separates those persons who are ready to work additional hours within a subsequent period, if they had the opportunity to do so, from those that are not available.
 - The criterion of **having worked less than a threshold relating to working time** (40 or 35 hours per week for this survey) excludes those workers who want to work additional hours and are available to do so but who already work a “sufficient” number of hours and therefore, for policy reasons, are considered to have reached their full employment level.

Precarious employment

Workers in precarious employment can be either: (a) workers whose contract of employment leads to the classification of the incumbent as belonging to the groups of “casual workers”, “short-term workers” or “seasonal workers”; or (b) workers whose contract of employment will allow the employing enterprise or person to terminate the contract at short notice and/or at will, with the specific circumstances to be determined by national legislation and custom. In the case of workers falling under the first category, workers may be classified as “employees” or “own-account workers”, according to the characteristics of the employment contract. Workers under category (a) refer to the following:

- Casual workers – contracts are not expected to continue for more than a very short period.
- Seasonal workers – contract duration is influenced by seasonal factors, such as climate, public holidays and agriculture season.
- Short-term workers – contracts are expected to last for a short period but longer than that of casual workers. The common element among the precarious employment categories is the risky, short-term nature of the employment contracts (category a) or their instability, as employers may terminate them upon short notice (category b).

Non-economic activity

Certain activities are not counted as productive and therefore fall outside the production boundary. Examples of such activities are:

- purely natural processes without any human involvement or direction, such as the unmanaged growth of fish stocks in international waters;
- basic human activities, such as eating, sleeping or taking exercise, that are impossible for one person to perform for another person;
- activities that produce no output, such as begging or stealing (however, if the goods so acquired are resold, the reselling is an economic activity).

The 1998 SNA also excludes the production of all services for own final consumption within the household. This means that the following activities, for example, are excluded, if they are provided by unpaid household members for the benefit of their household: cleaning, decorating and maintaining the dwelling occupied by the household, including small repairs; the cleaning, servicing and repair of household durables and other goods, including vehicles used for household purposes; preparing and serving meals for immediate consumption; the care, training and instruction of children; the care of sick, infirm or old people; and the transportation of household members.

Potential labour force

Potential labour force is defined as all persons of working age who, during the short reference period, were neither in employment nor in unemployment and: (a) carried out activities to “seek employment”, were not “currently available” but would become available within a short subsequent period (i.e. unavailable jobseekers); or (b) did not carry out activities to “seek employment”, but wanted employment and were “currently available” (i.e. available potential jobseekers).

Unit of interview

Unit of interview is any member of randomly selected households, and the unit of selection can be any household selected for the sample. The basic socio-demographic data will be collected for all members of the selected households, however for the employment status only persons aged 15 years and over will be surveyed.

Reference period

The interviews are uniformly distributed for the entire quarter, being carried out continuously (weekly) in each month of a given quarter. The reference period is a week, prior to the interview.

Labour force participation rate

The economic activity of a population depends on the demographic characteristics of that population. The proportion of economically active persons, therefore, differs between sub-groups of that population. These variations are measured by specific activity rates termed labour force participation rate. Labour force participation rate is defined as the ratio of the labour force to the working age population (15 + years), expressed as percentage.

Unemployment rate

Unemployment rate is the proportion of unemployed population to the total population in labour force. This rate measures the percentage of unemployed population in labour force.

Employment to population ratio

The employment-to-population ratio is defined as the proportion of a country’s working-age population that is employed. A high ratio means that a large proportion of a country’s population is employed while a low ratio means that a large share of the population is not involved directly in market-related activities, because they are either unemployed or (more likely) out of the labour force altogether.

Reliability of data

Since the survey estimates are based on a sample survey, they are subjected to sampling and non-sampling errors.

Sampling error

Sampling error is a result of estimating data based on a probability sampling, not on census. Such error in statistics is termed as relative standard error and often denoted as RSE which is given in percentage. This error is an indication to the precision of the parameter under study. In other words, it reflects the extent of variation with other sample-based estimates. Sampling errors of estimates on a few important variables at national levels are calculated separately as shown in the annex. For example, the labour force participation rate at the national level was 67.0 per cent with an RSE of 0.23 per cent and standard error (SE) of 0.16 per cent. At 95 per cent confidence interval ($\alpha = 0.05$), the labour force participation rate was in the range of 66.69–67.31 per cent.

Non-sampling error

To ensure high quality data, several steps were taken to minimize non-sampling errors. Unlike sampling errors, these errors cannot be measured and can only be overcome through several administrative procedures. These errors can arise as a result of incomplete survey coverage, frame defect, response error, non-response and processing errors such as during editing, coding and data capture.

Response error

Response error can occur due to differences and difficulty in interpreting questions, either by the enumerator or respondent. To minimize this error, intensive seven day long basic training and several refreshing trainings was conducted for the enumerators as well as supervising officers. In addition, random checks by the high-level officials of BBS and SID were carried out on households that were already canvassed by the enumerators to ensure the validity of the information recorded.

With regard to editing and processing errors, several consistency checks were done, both manually and computerized programme using CSPro; batch editing was done using STATA, to ensure the quality and acceptability of the data produced.

Rounding of estimates

The sum of individual figures may not always equal to the totals shown in related tables because of independent rounding to one decimal place.

Chapter 3

Population and household characteristics

Bangladesh 2016-17

This chapter presents a general picture of the estimated demographics and other important characteristics of households and the population, including age and sex of the population, household size, sex of the household head and the dependency ratio.

Chapter 3

Population and household characteristics

This chapter presents a general picture of the estimated demographics and other important characteristics of households and the population, including age and sex of the population, household size, sex of the head of the household, geographic distribution and area.

3.1 Population characteristics

According to the survey estimates, Bangladesh's total population was 161.3 million; of them, 81.0 million were male and 80.3 million were female (Table 3.1). The table also indicates that the percentage distribution was generally high, almost one third of the total population from the age group between 0 and 14 years for both sexes. The percentage of the very young population, aged 0-14 years (32.4 per cent), were still very high when compared with the percentage of those aged 65 or older (4.9 per cent). In sum: Bangladesh is a country with a young population.

Table 3.1 Distribution of the population, by sex, age group and area

(in million)

Age group	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
0-14	19.9	18.6	38.5	7.1	6.8	13.8	26.9	25.4	52.3

Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

The country's total population was 161.3 million for each quarter of the year 2016-17. Table 3.2 below indicates that the number and percentage distribution of population by sex for each quarter. Yearly estimates of the distribution of population is provided by sex and areas. The sex ratio of male and female population was a bit higher in rural (101.3) areas than that of urban (99.5) areas.

Table 3.2 Distribution of the population, by sex and quarter/year and area (in million)

Sex	Quarters of 2016-17				Yearly estimate of 2016-17		
	Q1	Q2	Q3	Q4	Rural	Urban	Total
Male	81.2	80.9	80.9	81.0	58.2	22.8	81.0

Sex ratio	101.2	100.6	100.6	100.9	101.3	99.5	100.8

The chart 3.1 below illustrated the distribution of population by age group and sex

3.2 Dependency ratio

The dependency ratio measures the proportion of children and older persons to the proportion of persons of workforce age. For the Labour Force Survey, the age dependency ratio was defined as the ratio of the sum of the population younger than 15 years and the population aged 65 or older, divided by the number of persons aged between 15 and 64 years. The age dependency ratio is thus a summary indicator of the burden falling on the working-age population.

As shown in table 3.3, total dependency ratio in 2016-17 was 59.5 per cent; by area, it was 51.5 per cent in urban areas and 62.9 per cent in the rural areas. The disparity is not so surprising,

considering the inactive population (aged 0–14 years and 65 or older) are more likely to concentrate in rural areas than the workforce population. Thus, the dependency ratio for the youth population was 45.8 per cent in urban areas and 54.2 per cent in the rural areas. Among the elder population, the dependency ratio was 5.7 per cent in the urban and 8.7 per cent in the rural areas.

Table 3.3 Dependency ratio of the population, by sex and area (in '000)

Age group	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
0-14 years	19863	18591	38454	7051	6779	13831	26914	25371	52285
15-64 years	34719	36192	70912	14769	15457	30227	49489	51649	101138
65+ years	3575	2604	6179	1015	721	1736	4591	3325	7915
Total	58158	57387	115545	22836	22957	45794	80994	80345	161338
Youth dependency ratio	57.2	51.4	54.2	47.7	43.9	45.8	54.4	49.1	51.7
Old-age dependency ratio	10.3	7.2	8.7	6.9	4.7	5.7	9.3	6.4	7.8
Total dependency ratio	67.5	58.6	62.9	54.6	48.5	51.5	63.7	55.6	59.5

3.3 Female-headed households and household size

Generally, the country is characterized as a patriarchal society; this is indeed reflected in the data, with nearly 85.8 per cent having a male head, compared with 14.2 per cent with a female head (table 3.4). By area, female-headed households are more, (15.1 per cent) in urban areas, compared with (13.8 per cent) in the rural areas. It was also observed from the table below that the household size is less for female-headed households.

Table-3.4: Distribution of sex of the head of the households and household size by area

Sex of the head of the household	Head of the household (%)			Household size		
	Rural	Urban	Total	Rural	Urban	Total
Male	86.2	84.9	85.8	4.3	4.1	4.2
Female	13.8	15.1	14.2	3.0	3.2	3.0
Total	100.0	100.0	100.0	4.1	3.9	4.1

3.4 Population by marital status

Population 10 years and over by marital status has been presented in Table-3.5. It is seen from the table that, among males 60.2 per cent were married compared to 65.6 per cent for the females. The proportion of widowed, divorced and separated were 1.5 per cent for males as against 9.5 per cent for females.

There exists an urban-rural differential in marital status. In the urban area, 37.0 per cent males and 25.6 per cent females were unmarried as against 38.8 per cent and 24.6 per cent for the rural area. In the urban area, 61.6 per cent males and 65.1 per cent females and in the rural area 59.7 per cent male and 65.8 per cent female were married. The percentage of divorced, widowed and separated were 1.5 per cent for male and 9.3 per cent for female in the urban area compared to 1.5 per cent for male 9.6 per cent for female in the rural area.

Marital status	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Unmarried	38.8	24.6	31.7	37.0	25.6	31.3	38.3	24.8	31.6
Married	59.7	65.8	62.7	61.6	65.1	63.4	60.2	65.6	62.9
Widow/Widower	1.1	8.5	4.8	1.0	7.8	4.4	1.1	8.3	4.7
Separated	0.2	0.6	0.4	0.2	0.9	0.5	0.2	0.7	0.4
Divorced	0.2	0.5	0.4	0.2	0.6	0.4	0.2	0.5	0.4
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

3.5 Tenure of dwelling houses

It is seen from the table 3.6 that, the proportion of rented house showed very high trend in urban areas (43.6 per cent) than that of rural areas (3.0 per cent). On the other hand, the percentage of owned houses was much higher in rural areas (89.5 per cent) than that of urban areas (50.8 per cent). The proportion of owned houses at the national level in 2016-17 was 78.3 per cent and it was a bit higher than in 2015-16 (77.0 per cent).

Type of ownership	2015-16			2016-17		
	Rural	Urban	Total	Rural	Urban	Total
Owned	88.2	49.9	77.0	89.5	50.8	78.3
Rented	3.5	43.5	15.2	3.0	43.6	14.8
Rent-free	8.4	6.6	7.8	7.4	5.6	6.9
Total	100	100	100	100.0	100.0	100.0

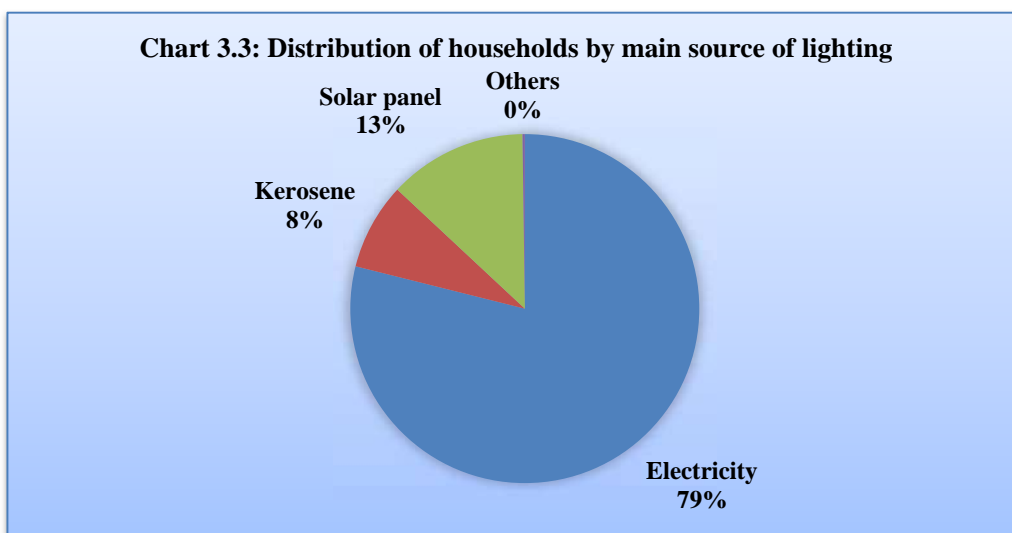

3.6 Households by sources of lighting

Household by sources of lighting has been presented in Table-3.7. It is observed that, the use of electricity is increasing over the period. Access to electricity was 72.3 per cent in 2015-16 where as it was 79.0 per cent during the survey period 2016-17. There exists clear rural-urban variation in the access of electricity, it was 72.4 per cent for the rural areas and 94.9 for the urban areas. With the increased use of electricity as the source of lighting, the use of other sources such as kerosene is decreasing consequently.

Table-3.7: Percentage distribution of households by main source of lighting and area

Main source of light	2015-16			2016-17		
	Rural	Urban	Total	Rural	Urban	Total
Electricity	64.1	92.0	72.3	72.4	94.9	79.0
Kerosene	24.6	5.8	19.1	10.7	1.7	8.0
Solar panel	11.0	2.0	8.4	16.7	3.4	12.8
Others	0.3	0.1	0.2	0.3	0.1	0.2
Total	100.0	100.0	100.0	100.0	100.0	100.0

There exists clear rural-urban variation in the access of electricity, it was 72.4 per cent for the rural areas and 94.9 for the urban areas. With the increased use of electricity as the source of lighting, the use of other sources such as kerosene is decreasing consequently.

3.7 Households by type of fuel used for cooking

Household by type of cooking fuel used has been displayed in Table 3.8. It is seen from the table that, wood/firewood (41.3 per cent) were the main fuel used for cooking by the households, followed by Dung / Leave / Straw (38.7 per cent) and natural gas/LP gas (19.6 per cent). It is notable that, use of natural gas increased in 2016-17 (19.6 per cent) compared to 2015-16 (18.7 per cent). There exists wide variation in the use of fuel in the urban and rural areas. In the urban area, as high as 53.9 per cent used natural gas for cooking compared to only 5.4 per cent in the rural areas.

Table-3.8: Percentage distribution of households by sources of fuel for cooking

Fuel used for cooking	2015-16			2016-17		
	Rural	Urban	Total	Rural	Urban	Total
Wood / firewood	47.0	32.5	42.8	45.0	32.3	41.3
Dung / Leave / Straw	48.2	13.6	38.1	49.5	12.8	38.7
Natural Gas / LP Gas	4.6	52.8	18.7	5.4	53.9	19.6
Kerosene	0.1	0.1	0.1	0.0	0.1	0.0
Electricity	0.1	0.6	0.2	0.0	0.0	0.0
Bio-Gas	0.1	0.2	0.1	0.0	0.5	0.2
Others	0.0	0.3	0.1	0.0	0.3	0.1
Total	100.0	100.0	100.0	100.0	100.0	100.0

3.8 Household by toilet facility

It is observed from the table 3.9 that, 46.0 per cent of the households reported to use sanitary toilet, followed by 37.0 per cent use pit latrine, 15.2 per cent households use katcha latrine and the rest 1.8 per cent of the households have no toilet facility. There exist wide urban-rural variations in the access to toilet facility. In the city corporation area, the highest 88.4 per cent use sanitary toilet as against 61.3 per cent of such facility in the urban areas and only 34.9 per cent in the rural area. Pit and Katcha latrine was very much dominated in the rural areas compared to urban and city corporation areas. The use of sanitary toilet has increased significantly between 2015-16 at 41.1 per cent and 2016-17 at 46.0 per cent.

Table 3.9: Access to toilet facilities by type and area

Type of toilet	2015-16				2016-17			
	Rural	Urban	City corporation	Total	Rural	Urban	City corporation	Total
Sanitary (water-sealed)	30.6	57.5	78.9	41.1	34.9	61.3	88.4	46.0
Pit latrine	40.3	28.1	16.9	35.3	43.9	28.4	9.8	37.0
Katcha toilet	25.6	13.3	4.2	20.8	18.9	9.5	1.7	15.2
Open air / No toilet	3.6	1.1	0.1	2.7	2.4	0.7	0.0	1.8
Total	100	100	100	100	100.0	100.0	100.0	100.0

3.9 Household by sources of drinking water

Household by sources of drinking water obtained from the survey have been presented in table 3.10 and in chart-3.4. It is clear from the table below that the use of Tube well was the dominant (88.0 per cent) type of source of drinking water both in rural (95.6 per cent) and urban (86.7 per cent) and city corporation (47.4 per cent) areas. However, tap water is the second highest (10.1 per cent) source of drinking water.

Table 3.10: Distribution of households by main source of drinking water and area

Main source of drinking water	2016-17			
	Rural	Urban	City corporation	Total
Tap water	2.1	12.8	51.6	10.1
Tube well/deep tube well	95.6	86.7	47.4	88.0
Well	0.6	0.1	0.0	0.5
Pond/River/ Ditch/ Canal	1.1	0.1	0.0	0.9
Others	0.5	0.3	0.9	0.5
Total	100.0	100.0	100.0	100.0

Chapter 4

Education and training

Bangladesh 2016-17

This chapter highlighted the inquiries about literacy and full-time education among all household members aged 5 years or older as well as training opportunities outside the general education system among household members aged 15 or older.

Chapter 4

Literacy, Education and Training

The lack of education opportunities among the working-age population clearly contributes to the enabling of unemployment and the weak chances of finding better paid jobs or jobs with greater security and benefits. The country's development largely depends on having skilled persons and it is imparted through the education system and also through further formal training, which may be specifically related to the requirements of the job. The survey inquired about literacy and full-time education among all household members aged 5 years or older as well as training opportunities outside the general education system among household members aged 15 or older.

4.1 Literacy profile

Literacy is defined as the ability to read and write in either Bangla, the mother tongue of Bangladesh or in some other language. As shown in Table 4.1, an estimated 69.0 per cent of the population aged 15 or older was literate. Urban areas reflected the higher literacy rate, at 78.0 per cent, compared with 65.2 per cent for the rural areas. A wide gap is evident between the sexes, with the male literacy rate at 72.7 per cent and the female literacy rate at 65.3 per cent.

Only among the youth (aged 15–29) was there barely a gap, even the literacy rate was better for females than males: Of the estimated 91.4 per cent literacy among the country's youth, it was 91.3 per cent for males and 91.4 per cent for females overall. By area, the literacy rate among the youth was highest in urban areas, at 93.1 per cent, and again with a very little gap between the sexes, at 93.5 per cent for urban males and 92.7 for urban females.

Table 4.1 Literacy rate of the population aged 15 or older, by sex, age group and area

Age group	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
15-29	90.4	90.8	90.6	93.5	92.7	93.1	91.3	91.4	91.4
30-64	60.0	47.8	53.8	77.4	63.4	70.6	65.3	52.2	58.7
65+	38.0	11.1	26.6	54.8	25.4	42.6	41.7	14.2	30.1
Total	69.0	61.6	65.2	81.8	74.3	78.0	72.7	65.3	69.0

There exists urban-rural variation in respect of literacy rate, the literacy rate was higher in city corporation (79.9 per cent) than that of urban (76.7 per cent) and rural (65.2 per cent) areas. The literacy rate variation was narrow between locality of the country (Table 4.2).

Table 4.2 Literacy rate of the population aged 15 or older, by sex and locality (million)

Locality	Literate			Working age population			Literacy rate		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Rural	26.4	23.9	50.3	38.3	38.8	77.1	69.0	61.6	65.2
Urban	7.3	6.8	14.1	9.1	9.3	18.4	80.5	72.9	76.7
City corporation	5.6	5.2	10.8	6.7	6.9	13.5	83.6	76.2	79.9
Total	39.3	35.9	75.2	54.1	55.0	109.1	72.7	65.3	69.0

Literacy rate of the survey period is depicted below for each quarter by sex and area (Table 4.3). There were clear variations in the literacy rate between male and females and rural and urban areas.

Table 4.3 literacy rate of population aged 15 or older, by quarter, sex and area

Quarter	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Q1	68.4	61.1	64.8	81.5	73.8	77.6	72.2	64.9	68.5
Q2	68.7	61.2	64.9	81.8	74.1	77.9	72.6	65.0	68.8
Q3	69.8	62.2	66.0	82.3	74.8	78.5	73.4	65.9	69.6
Q4	68.9	61.7	65.3	81.6	74.6	78.1	72.6	65.5	69.0
Year	69.0	61.6	65.2	81.8	74.3	78.0	72.7	65.3	69.0

4.2 Education profile

As reflected in table 4.4, an estimated 11.1 per cent of the population aged 15 or older was attending school at the time of the survey, while 29.3 per cent had never attended school and 59.6 per cent was attended school in the past. The sex disaggregation of the data indicates that about 12.6 per cent of all males aged 15 or older and 9.6 per cent of all females were attending school at the time of the survey. Among those who had never attended school, the proportion of females (31.9 per cent) was much higher than that of males (26.7 per cent).

Table 4.4 Population aged 15 or older by attended school status, sex and area

Status of attended school	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Attended school as % of working age population									
Yes, currently attending	12.6	8.8	10.7	12.6	11.5	12.1	12.6	9.6	11.1
Yes. Attended in the past	57.2	55.7	56.5	69.4	65.0	67.2	60.7	58.5	59.6
No, never attended	30.2	35.4	32.8	18.0	23.5	20.8	26.7	31.9	29.3
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

As shown in table 4.5, an estimated 30.6 per cent of the population aged 15 or older had completed nothing i.e., no class passed, 22.3 per cent had completed the primary level, 35.0 per cent had completed secondary school and 4.2 percent had completed tertiary level of education.

Table 4.5 Proportion of population aged 5 or older, by level of completed education, sex and area

Broad education group	Rural			Urban			Bangladesh

Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

4.3 Vocational training

Vocational training outside the formal school system provides an important opportunity for many people to develop skills useful in the workforce. The survey asked everyone aged 15 or older if they had ever engaged in any vocational training and, if so, duration, source and what type of training. If someone had participated in more than one training course, only the most important training was discussed. Based on the findings (table 4.6), an estimated 1.9 million persons (about 1.7 per cent of the total working age population) have participated in a formal training course outside the general school system. The proportion of training in urban areas (3.4 per cent) was much higher than that of rural areas (1.1 per cent) for both sexes.

Table 4.6 Proportion of population aged 15 or older who has received training, by sex and area (in 000)

Received Training	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Received training as % of working age population									
Yes	1.3	0.8	1.1	4.3	2.5	3.4	2.2	1.3	1.7
No	98.7	99.2	98.9	95.7	97.5	96.6	97.8	98.7	98.3
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

As indicated in table 4.7 below, the most frequent duration of training was found in 1-2 weeks, at 45.4 per cent, followed by 3-4 weeks, at 27.3 per cent, 1-3 months, at 15.0 per cent.

Table 4.7 Population aged 15 or older who has received training, by duration of training, sex and area

Duration of Training	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
< 1 week	16.3	4.5	11.8	11.5	6.2	9.5	13.6	5.5	10.5

Chapter 5

Economic activities and the labour force

Bangladesh 2016-17

This chapter covers data on the working-age population, distribution of working age population by locality, sex and age group. Current economic activity status and labour force participation among the population aged 15 or older is also reflected in this chapter.

Chapter 5

Economic activities and the labour force

This chapter covers data on the working-age population, current economic activity status and labour force participation aged 15 years and above. The economically *active population* (or *labour force*) encompasses all persons employed and all those who are unemployed. People are classified as *employed*, *unemployed* or *outside the labour force* according to definitions of the International Labour Organization (ILO). The *activity rate* is the share of the population that is economically active. The estimates reported here are based on the Quarterly Labour Force Survey (QLFS) 2016-17. Respondents are classified as employed, unemployed and outside the labour force based on information collected through the survey questionnaire, which mainly relates to their actual activity during a particular reference week. QLFS estimates are available by various breakdowns – by age, sex, educational attainment and many other dimensions.

5.1 Working-age population

The country's working age population (aged 15 or older) experienced dramatic changes over the past decade and around 109.1 million in 2016-17.

Table 5.1 refers, 41.3 million persons were 15-29 years old (of them, 19.6 million were male and 21.6 million were female), and 59.9 million persons were 30-64 years old (29.9 million males and 30.0 million females). Around 7.9 million persons were aged 65 or older (4.6 million of them male and 3.3 million female). The largest proportion of working-age population was in the urban areas, at 69.8 per cent whereas it was at 66.7 per cent of the total rural population.

Age group	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
15-29	13856	14661	28517	5777	6959	12736	19633	21620	41254

Total	65.8	67.6	66.7	69.1	70.5	69.8	66.8	68.4	67.6

5.2 Economic activity

A person aged 15 years and over is considered currently economically active if he or she is either employed for at least one hour during the seven days prior to the survey, or has a job attachment but is temporarily absent from work or is available to work if work could be found.

Table 5.2 Working age population aged 15 or older, by Labour force status, sex and area (in '000)

Total	35.1	35.6	70.7	14.5	14.8	29.3	49.6	50.4	100.0

Based on the survey findings (table 5.2), an estimated 63.5 million population aged 15 or older were in the labour force at the time of the survey. Male labour force accounted for 43.5 million (45.5 per cent of total), with 20.0 million females (35.0 per cent of total). An estimated 45.6 million of the population, however, was not in the labour force (10.6 million male and 34.9 million female). Of the total 77.1 million working-age population in rural areas, 45.7 million were in the labour force, while 31.4 million were outside the labour force.

Table 5.3 Labour force aged 15 or older, by age group, sex and area (in 000)

Total labour force	30739	14957	45696	12790	5018	17808	43528	19976	63504
Total 15+ population	38295	38796	77091	15785	16178	31963	54080	54974	109054
Total population	58158	57387	115545	22836	22957	45794	80994	80345	161338
Labour force as % of working age population									
15-29	24.0	12.2	18.1	24.7	13.9	19.2	24.2	12.7	18.4
30-64	51.7	25.7	38.6	53.7	16.8	35.0	52.3	23.1	37.6
65+	4.6	0.6	2.6	2.7	0.3	1.5	4.0	0.5	2.2
Total	80.3	38.6	59.3	81.0	31.0	55.7	80.5	36.3	58.2
% of total population									
15-29	15.8	8.3	12.1	17.1	9.8	13.4	16.2	8.7	12.4
30-64	34.0	17.4	25.8	37.1	11.9	24.4	34.9	15.8	25.4
65+	3.0	0.4	1.7	1.8	0.2	1.0	2.7	0.4	1.5
Total	52.9	26.1	39.5	56.0	21.9	38.9	53.7	24.9	39.4

The intervals of age groups were different that's why it is not significant to compare the distribution among age groups. Nonetheless, a comparison between the male and female data indicates the total male labour force (43.5 million or 80.5 per cent) was larger than the total female labour force (20.0 million or 36.3 per cent) overall as well as in both urban and rural areas (table 5.3).

5.3 Labour force participation rate

The labour force participation rate (LFPR) is defined as the number of persons in the labour force, given as a percentage of the working-age population. The labour force participation rate provides information about the relative size of the labour supply currently available for the production of goods and services. It is an important indicator for economic growth and is also used to monitor progress in the labour market. LFPR is defined as the number of persons in the labour force (employed + unemployed) expressed as a percentage of the total working age population.

$$LFPR = \frac{\text{Total labour force}}{\text{Total working age population}} \times 100\%$$

As shown in table 5.4, Bangladesh's labour force participation rate (the proportion of population aged 15 or older who were currently economically active) in 2016-17 was estimated at 58.2 per cent. By sex, the labour force participation rate was 80.5 per cent for males and 36.3 per cent for females. The rate was slightly higher for the rural areas (59.3 per cent) than that of urban (55.7 per cent). The highest labour force participation rates by broad age groups were among workers aged 30-64 (68.4 per cent), followed by 15-29 (48.7 per cent) and lowest in 65+ age group (31.0 per cent).

Table 5.4 Labour force aged 15 or older, by age group, sex and area

Labour force participation rate in 2016-17 by education attainment and sex is presented in table-5.5 below. By education, the labour force participation rate varied significantly, highest 79.4 per cent for tertiary level completed and lowest 48.3 per cent for those who could not specify their education level.

Table 5.5 Labour force participation rate aged 15 or older, by education group, sex and area (in 000)

Education group by UNESCO	Rural			Urban			Bangladesh

Chart 5.2 illustrated that, the highest labour force participation rate for males were among persons with primary level completed (91.5 per cent) and lowest in others/not specified education group (56.3 per cent). For females, the labour force participation rate was highest 56.9 per cent for “tertiary” level completed and lowest 16.8 per cent for “others/not specified” education level.

5.4 Trends of Labour force

Chart 5.5: Trends of LFPR by quarter and area

Chart 5.6: Trends of LFPR by quarter and sex

Chapter 6

Employment

Bangladesh 2016-17

This chapter looks at the characteristics of the employed population. Employment comprise all persons above 15 years of age who during a specified brief period such as last 1 week, performed some work (at least 1 hour in a week) for wage or salary in cash and/or in kind, or for profit or family gain, or for production of goods for own consumption. Employments are of particular interest when broken down by sex, can provide information on gender differences in labour market activity.

Chapter 6

Employment

This chapter looks at the characteristics of the employed population, such as the occupations and industries where people work, their level of education and their employment status. The "employed" comprises all persons older than a specified age (15 years) who, during a specified period (seven days prior to the survey) was involved in any form of work for wage or salary, profit or family gain and including the production of goods for own consumption.

6.1 Employment by age group sex and area

As shown in table 6.1, of the 109.1 million persons aged 15 years or older, 60.8 million of them (55.8 per cent) were in employment or engaged in economic activity; 18.7 million of them (33.9 per cent) were females. Almost 18.0 million or 29.5 per cent of the employed population was in the younger age groups, 15–29 years old. About two-thirds (66.5 per cent) of the employed population was belongs to the adult age group (30–64), whereas only 4.0 per cent of the employed population from the age group 65+ years old.

The following chart 6.1 illustrates the overlaying distribution of working age population (WAP) and employed persons by age group and sex.

6.2 Employment by occupation and industry

As table 6.2 indicates, the largest share of all employed persons (32.4 per cent) was skilled agriculture workers. Some 17.2 per cent were employed in elementary occupations, followed by 17.0 per cent in Craft and Related Trades Workers, 16.5 per cent in Service and Sales Workers. In urban areas, the largest share by far, at 24.6 per cent, of the employed population was in Craft and Related Trades Workers; within sex, 21.5 per cent were male and 33.0 per cent were female. In rural areas, skilled agriculture workers accounted for the largest share of the employed population, at 41.2 per cent, with the breakdown by sex, 63.0 per cent were females among female employed.

In terms of the distribution of the employed population by broad economic sector (Chart 6.3), the largest proportion was in agriculture, at 40.6 per cent, followed by 39.0 percent in services and 20.4 per cent in industry sector.

The distribution of the employed population varies widely by locality and sectors (Table 6.4). In rural areas, the largest proportion was in agriculture, at 51.7 per cent, followed by 31.1 percent in services and 17.0 per cent in industry sector. In both urban and city corporation areas, the service sector is dominant (57.5 and 60.4 per cent respectively). Agriculture comprises of only 2.9 per cent in the city corporation areas of employed population.

6.3 Employment by literacy status and education attainment

More than two-third (69.3 per cent or 42.1 million) of the estimated employed population at the time of the survey was literate (table 6.6) whereas one third (1.9 million or 30.7 per cent) of the employed population was not literate. About 67.0 per cent of the employed male in the rural areas was literate; it was 81.0 per cent in the urban areas.

Among the employed males, an estimated 26.5 per cent of them had completed their primary education, 30.4 per cent who had completed their secondary education, and 6.1 per cent who had graduated university education. About 28.9 per cent of the employed male had no education at all. At 36.4 per cent of the female employed had no education, followed by 31.7 per cent had completed secondary education, 24.2 per cent had completed primary school, and only 3.4 per cent had completed tertiary level.

The largest proportion of the employed population in urban areas, 33.5 per cent (5.7 million), had a secondary education, while the largest proportion of the employed population in rural areas, at 35.7 per cent (15.7 million) had no education.

Total	29809	14076	43885	12372	4570	16943	42182	18646	60828

As shown in chart 6.6 below, the largest share of the employed population (44.3 per cent) worked as own-account workers, followed by (39.1 per cent) as employees and contributing family workers (11.5 per cent).

6.5 Employed population by ownership

The largest share of the employed population (60.9 per cent) belongs to Individual proprietorship category, followed by (20.8 per cent) from Households category, 13.6 per cent from Private category. Only 3.8 per cent employees belongs to Government/Autonomous/local government categories, as shown in table 6.11 below. Between the sexes by largest share, there were more males in all categories except among Household category, where there were more employed females (47.4 per cent among female employed) than employed males (9.1 per cent among male employed).

Chart 6.10: Trends employed persons by quarter and status in employment

Chapter 7

Informal employment

Bangladesh 2016-17

This chapter presents the data on informal employment by occupations and industries, sex, age group and education levels. Informal sector contributes significantly to the economy, particularly in terms of employment, by providing economic opportunities to those displaced from or who cannot be absorbed by the formal sector.

Chapter 7

Informal employment

This chapter presents the data on informal employment by institutional sector, occupations and broad economic and education levels. Informal employment is a job-based concept and encompasses those jobs that generally lack basic social or legal protections or employment benefits and may be found in the formal sector, informal sector or households. Nearly all categories of informal sector employment are also classified as informal employment. The informal employment rate is considered as an important indicator regarding the quality of employment in an economy.

Persons can be defined as working in the informal sector in terms of their main activity. For the QLFS, the operational (statistical) definition for informal employment in Bangladesh was a combination of both the informal character of the individual job as well as employment in the informal sector:

- i All individual job-based informal employment – operationally comprises all employed persons in the non-agriculture sector, both wage and salaried workers (employees) with no pension or no contribution to a retirement fund;
- ii All contributing family workers;
- iii All employers and own-account workers in the informal sector enterprises (operationally defined as all private unincorporated enterprises engaged in non-agriculture work that do not have any registration);
- iv All own-account workers employed in a private household.

7.1 Informal employment by sex and area

Informal employment is dominating in the country and according to the Chart 7.1, at the national level, 85.1 per cent of the employed population engaged in informal employment; it was 91.8 per cent females and 82.1 per cent for the male counterparts.

Table 7.1 Employed population aged 15 or older, by formal/informal sector, sex and area (in 000)

Sector of employment	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total

Informal	85.6	93.3	88.1	73.6	87.3	77.3	82.1	91.8	85.1
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Table 7.1 indicates, the contribution of informal employment in urban areas was 13.1 million (77.3 per cent), and in rural areas, it was 38.6 million (88.1 per cent). In rural areas, 13.1 million (93.3 per cent) of the females are in informal employment whereas it was 4.0 million (87.3 per cent) in urban areas. Overall, 51.7 million (85.1 per cent) of the total employed persons (60.8 million) in the country were informally employed.

Chart 7.2 indicates, the contribution of informal employment in urban areas was 77.3 per cent, and in rural areas, it was 88.1 per cent. In rural areas, 93.3 per cent of the females are in informal employment whereas it was 87.3 per cent in urban areas.

Table 7.2 indicates that of a total of 51.7 million persons engaged in informal employment, of them 31.0 per cent were 15–29 years old, while 64.9 per cent were 30–64 years old; only 4.1 per cent were 65 or older. Overall, informal employment among females was far higher (91.9 per cent) than that of male (82.0 per cent) counterparts. The percentage distribution of informal employment from Chart 7.2 portrays a scenario, where both in rural and urban areas, the proportion of informal employment in rural areas for females (93.3 per cent) is higher than in urban areas (87.4 per cent).

<i>Table 7.2: Informal employment aged 15 or older, by age group, sex and area</i>									
<i>(in '000)</i>

Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Informal employment as % of total employment									
15-29	88.9	91.8	89.8	86.0	91.3	87.8	88.0	91.6	89.2
30-64	83.7	94.0	87.1	68.3	84.5	72.2	79.1	92.0	83.0
65+	88.3	90.6	88.5	76.4	93.3	78.2	86.0	91.0	86.6
Total	85.4	93.3	88.0	73.7	87.4	77.3	82.0	91.9	85.0

Informal employment varies widely by broad age group and rural and urban areas. In urban areas, informal employment was 77.3 per cent, and it was 88.0 per cent in rural areas, where the largest number of informally employed persons engaged. The percentage distribution of informal employment portrays a scenario, where both in rural and urban areas, the proportion of informal and formal employment in rural areas for females (93.3 per cent) is higher than in urban areas (87.4 per cent). Table 7.2 shows that, both in rural and urban areas, females and youths aged 15-29 are more likely to be in the informal employment than male counterpart.

The distribution of formal/informal employment by sex and area over administrative divisions is illustrated in table 7.3 below:

<i>Table 7.3: Informal employment aged 15 or older, by division, area and sex</i>									
Division	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Barisal	81.0	90.6	83.6	68.0	74.8	69.5	78.5	88.2	81.1

Total	85.4	93.3	88.0	73.7	87.4	77.3	82.0	91.9	85.0

7.2 Informal employment by economic sectors and occupations

The distribution of the informal employment across the broad economic sectors is shown in Chart 7.3. The percentage of informally employed persons in total employment was very high in all sectors; in particular, it was 95.4 per cent in Agriculture sector, followed by Industry sector (89.9 per cent) and service sector (71.8 per cent).

Informal employment varies widely by economic sectors. It indicates that 95.4 per cent of the total employment of the agriculture sector engaged in the informal employment, followed by 89.9 per cent of industry sector and 71.8 per cent of the service sector engaged in the informal employment. Table 7.4 below also shows that there were wide variations in the rate of informal employment by area in all the sectors.

Table 7.4 Employed population aged 15 or older, by formal/informal employment, sector and area

Sector of employment	Rural			Urban			Bangladesh		
	Formal	Informal	Total	Formal	Informal	Total	Formal	Informal	Total
Agriculture	1015	21684	22699	129	1864	1994	1145	23548	24693

Total	11.9	88.1	100.0	22.7	77.3	100.0	14.9	85.1	100.0
Row %									
Agriculture	4.5	95.5	100.0	6.5	93.5	100.0	4.6	95.4	100.0
Industry	9.4	90.6	100.0	11.1	88.9	100.0	10.1	89.9	100.0
Service	25.7	74.3	100.0	31.8	68.2	100.0	28.2	71.8	100.0
Total	11.9	88.1	100.0	22.7	77.3	100.0	14.9	85.1	100.0

7.3 Formal employment by education attainment

As indicated in table 7.5, the incidence of formal employment was far higher among the highly educated (Tertiary education 48.3 per cent, followed by higher secondary education 32.0 per cent, secondary levels 19.1 per cent, primary levels 10.8 per cent, and no education 5.6 per cent).

Table 7.5 Formal employment aged 15 or older, by education level, sex and area *(in 000)*

Occupation	Formal employment			Total employment			Formal as % of total employment		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
None	815	271	1086	12584	6792	19376	6.5	4.0	5.6
Primary	1454	246	1699	11194	4505	15699	13.0	5.5	10.8
Secondary	3035	536	3571	12805	5905	18710	23.7	9.1	19.1
Higher secondary	1004	162	1165	2836	801	3637	35.4	20.2	32.0
Tertiary	1240	310	1550	2581	627	3209	48.0	49.4	48.3
Others	22	0	22	182	14	197	12.0	2.9	11.3
Total	7569	1525	9094	42182	18646	60828	17.9	8.2	14.9

There exists a clear positive correlation between higher education attainment and formal employment i.e., highly educated persons are more likely to be in the sector of formal employment and less educated are more likely to be employed in the informal employment (Chart 7.4).

7.4 Trends of informal employment rate

Chapter 8

Unemployment

Bangladesh 2016-17

Unemployment reflects the inability of an economy to generate employment for those persons who want to work but are not doing so, even though they are available for employment and actively seeking work.

It is an indicator of the efficiency and effectiveness of an economy to absorb its labour force and of the performance of the labour market.

Chapter 8

Unemployment

8.1 Unemployment

The standard definition of unemployment is based on the following three criteria, which should be satisfied simultaneously: "without work", "currently available for work" and "seeking work". For the survey regarding unemployment "job search" applied only to people not employed in the seven days prior to the interview. Requirements for unemployment were defined as follows:

- a) "In the past 30 days, did (NAME) look for a job or try to start a business?"
- b) "Did (NAME) want to work in the past seven days?"
- c) "If an opportunity to work had existed, would (NAME) have been able to start work in the past seven days?"

Nevertheless, the criterion of seeking work, persons without work and currently available for work who had made arrangements to take up paid employment or undertake a self-employed activity at a date subsequent to the reference period (future engagements) should be considered as unemployed. Persons temporarily absent from their jobs with no formal job attachment (laid off) who were currently available for work and seeking work should be regarded as unemployed.

In this context, "availability for work" is interpreted as ability and readiness to work, provided the person is given a work opportunity. One purpose of the availability criterion is to exclude both persons who are seeking work to begin at a later date (a test of the current readiness to start work) and those who cannot start work for certain reasons (family responsibilities, studies, etc.).

The validity of the "current availability" criterion in terms of time need not be limited to the reference week or day but rather extended to one week or two weeks beyond the basic survey reference period.

- The "seeking work" criterion can be interpreted as activity or efforts undertaken during the specified reference period or prior to find a job. Such efforts may include:
 - registration at a public or private employment agency;
 - application to employers, checking at work sites;
 - placing or answering newspaper advertisements;
 - seeking assistance from friends or relatives;
 - arranging for land, machinery or resources etc.
- The job search period is not limited to the specified reference period – usually one month or the past four weeks, including the survey reference period.

8.2 Unemployed by age group and sex

The distribution of the unemployed persons aged 15 years and over in terms of their age group and sex is reflected in Chart 8.1. Of those, about 1358 thousand youths aged 15-24 were more likely to be unemployed in 2016-17, followed by 722 thousand in the age group 25-29 and 546 thousand in the age group 30 years and above were considered as unemployed.

As reflected in table 8.1, the survey found an estimated 2.68 million unemployed persons aged 15 or older. Of them, 1.36 million were youth, aged 15–24 years (50.8 per cent) and 1.32 million were adults, aged 25+ years (49.2 per cent). The absolute number of unemployed females (1.33 million) was almost same as male counterparts (1.35 million). There were far more unemployed persons in rural areas (1.81 million) than in urban areas (0.87 million).

Table 8.1 Unemployed population aged 15 or older, by age group, sex and area

Broad age group	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total

Total	929	882	1811	417	448	866	1347	1330	2677

Table 8.3 reflects the distribution of the unemployed in terms of their education level. Of those who were unemployed in 2016-17, 300 (at 11.2 per cent) thousand had no formal education, about 428 thousand (at 16.0 per cent) had completed primary school, 897 thousand (at 33.5 per cent) had finished secondary school, 638 thousand (at 23.8 per cent) had finished higher secondary school, 405 thousand (at 15.1 per cent) had graduated from university and nine thousand persons had other forms of education.

Table 8.3 Unemployed population aged 15 or older, by education level, sex and area (in 000)

8.3 Unemployment rate

The unemployment rate signals to some extent the underutilization of the labour supply. It reflects the inability of an economy to generate employment for those persons who want to work but are not doing so, even though they are available for employment and actively seeking work. It is thus seen as an indicator of the efficiency and effectiveness of an economy to absorb its labour force and of the performance of the labour market. The unemployment rate is defined as the percentage of unemployed persons in the labour force.

BBS has defined the unemployment rate (also known as the level of unemployment) as the number of unemployed persons expressed as a percentage of the total labour force.

$$\text{Unemployment rate} = \frac{\text{Total unemployed}}{\text{Total labour force}} \times 100\%$$

8.4 Unemployment rate by age group

The overall estimated unemployment rate (defined as the unemployed as a percentage of the labour force) was 4.2 per cent, it was 4.9 for urban and 4.0 for rural (table 8.4). The highest unemployment rate was found among youths, those aged 15-24 (12.3 per cent), followed by those aged 25-34 years (5.7 per cent).

Table 8.4 Unemployment rate aged 15 or older, by age group, sex and area (in 000)

Broad age group	Rural			Urban			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
15-24	9.9	16.4	11.9	10.6	17.4	13.2	10.1	16.8	12.3
25-34	3.7	8.3	5.4	4.0	10.9	6.2	3.8	9.0	5.7
35-44	0.8	2.0	1.2	0.9	2.4	1.3	0.8	2.1	1.2
45-54	0.8	0.9	0.8	0.8	0.9	0.8	0.8	0.9	0.8
55+	0.7	0.3	0.6	0.5	0.1	0.5	0.6	0.3	0.6
Total	3.0	5.9	4.0	3.3	8.9	4.9	3.1	6.7	4.2

Chart 8.3 includes an unemployment rate by sex and age group. At the national level, female unemployment rate (6.7 per cent) was quite higher than that of male counterpart (3.1 per cent). Unemployment rate was higher in each of the age group of females than males.

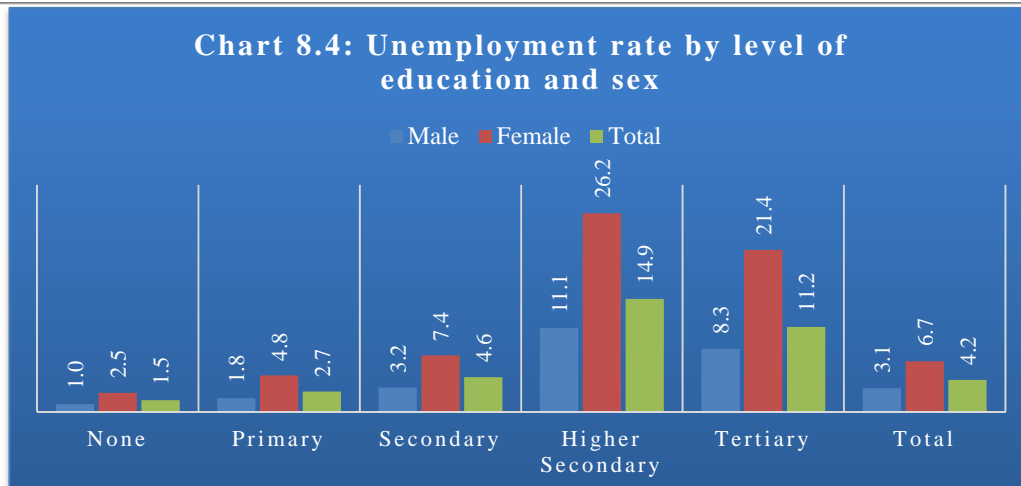

8.5 Unemployment rate by level of education

Table 8.5 illustrates that unemployment rate was highest in Higher secondary group (14.9 per cent), followed by Tertiary level (11.2 per cent) level, Others education group (4.6 per cent) and Secondary (4.6 per cent) level. For the less educated (primary 2.7 per cent, none 1.5 per cent) group, the unemployment rate was less than the national average at 4.2 per cent (Chart 8.4).

Table 8.5 Unemployment rate aged 15 or older, by education, sex and area

Education	Rural			Urban			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
None	1.0	2.5	1.6	0.9	2.2	1.4	1.0	2.5	1.5

Others	4.8	0.0	4.4	5.6	2.5	5.5	4.9	0.3	4.6
Total	3.0	5.9	4.0	3.3	8.9	4.9	3.1	6.7	4.2

8.6 Unemployment rate by literacy status

Chart 8.5 illustrates that unemployment rate was highest in literate persons (5.3 per cent) than that of illiterate persons (1.7 per cent). Unemployment rate was highest for urban females (11.2 per cent), followed by rural females at 7.6 per cent. For both rural and urban areas, unemployment rate for male and females was higher for literate persons than non-literate persons.

As shown in Table 8.6, unemployment rate for the literate persons is higher than illiterate persons in both urban and rural areas for both sexes. Literate persons reflected the higher unemployment rate for females in urban areas, at 11.2 per cent, compared with 7.6 per cent for females of the rural areas and 8.6 per cent at the national level for female literate persons. A wide gap is evident between the unemployment rate by literacy and illiteracy.

Table 8.6: Unemployment rate aged 15 or older, by literacy, area and sex (in 000)

Literacy	Rural			Urban			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Unemployment rate									
Literate	4.0	7.6	5.1	3.8	11.2	5.7	3.9	8.6	5.3
Not-literate	1.1	2.8	1.7	1.0	2.5	1.5	1.0	2.8	1.7
Total	3.0	5.9	4.0	3.3	8.9	4.9	3.1	6.7	4.2

8.7 Unemployed persons by mode of looking for job

To better capture all forms of unemployment, a usual relaxed definition was used in the survey, based on the following three criteria:

- (i) not employed-during last seven days;
- (ii) job search in the past 30 days; and
- (iii) availability to start work in the past seven days.

Those who satisfied the first two criteria, was requested to answer the mode of looking for job. The chart 8.6 below shown the distribution of the mode of looking for job by the unemployed persons.

Table 8.7 illustrates the mode of looking for job of unemployed aged 15 or older, by area and sex. Requesting friends / relatives for job was the highest (38.1 per cent) mode of searching for job at the national level, followed by newspaper advertisement (22.6 per cent), visiting firm (16.0 per cent). Applying though internet was only 6.9 per cent at the rural areas, whereas it was 14.5 per cent at the urban areas.

Table 8.7 Mode of looking for job of unemployed aged 15 or older, by area and sex

Mode of looking for job	Rural			Urban			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total

8.8 Reasons for not looking for job

Chart 8.7 illustrates the reasons for not looking for job by the persons not in the labour force aged 15 or older, by area and sex. Housework/family work was the prime reason (64.5 per cent) for not looking for job at the national level for both sexes; among females, it was the highest (81.1 per cent) whereas it was only 8.1 per cent among males.

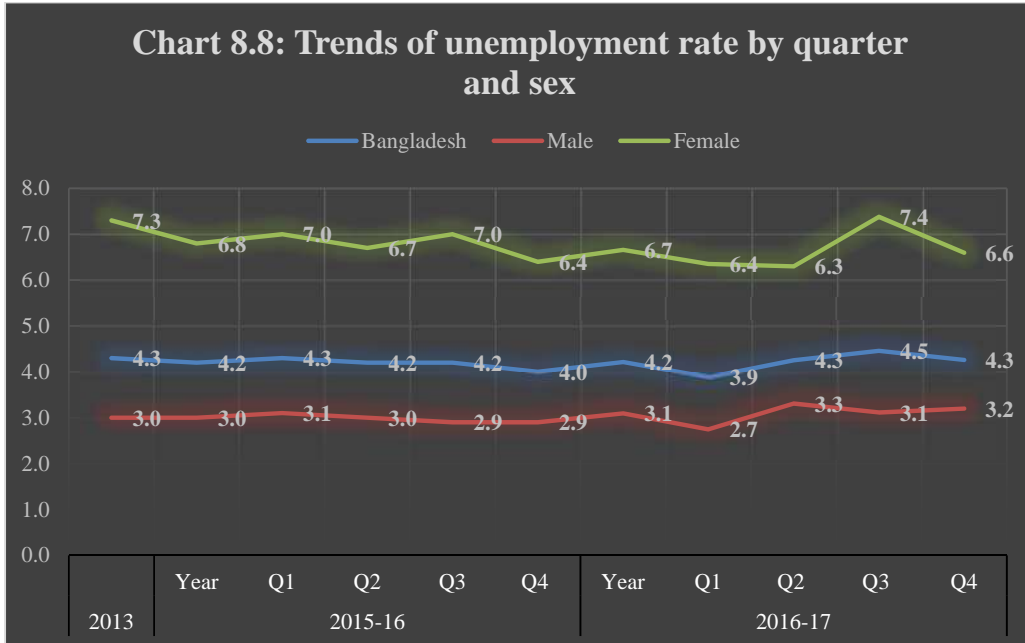

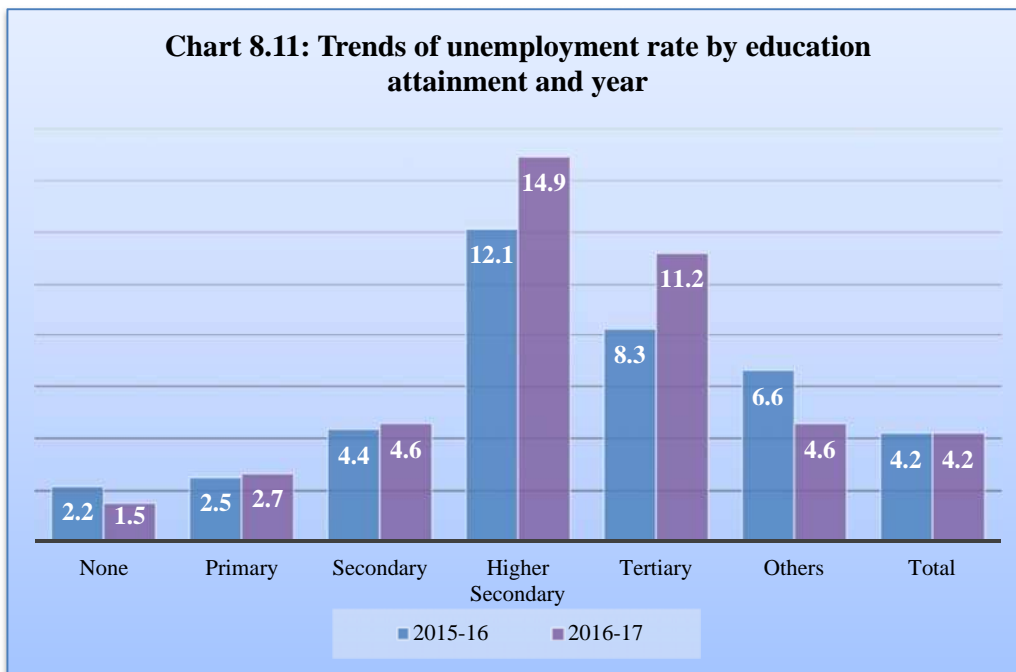

Table 8.8 also illustrates that Housework/family work was the highest reason for females (81.1 per cent) for not looking for job by the persons not in the labour force at the national level, whereas it was in school/training for male (49.2 per cent) counterparts.

Table 8.8: Not looking for job aged 15 or older outside labour force, by reason, area and sex

8.9 Trends in unemployment rate

Chapter 9

Youth employment and unemployment

Bangladesh 2016-17

This chapter describes the characteristics of the youth population, covering such topics as youth labour force participation, youth employment, youth unemployment and youth not in employment. The share of youth NEET, assumed to be associated with the complexities of youths' transition to labour market and vulnerabilities, is also covered in this chapter.

Chapter 9

Youth employment and unemployment

This chapter describes the characteristics of the youth population, covering such topics as youth labour force participation, youth employment, youth unemployment and youth not in employment. The youth unemployment rate is defined as the proportion of the youth labour force that is unemployed. The age of youth was defined as 15-24 and 15-29 years; it is also disaggregated by five-year age groups, those aged 15-19, 20-24 and 25-29. The age of youth was also defined as 18-35 years by the department of youth, Bangladesh.

9.1 Youth labour force participation

As shown in table 9.1, more than 20.0 million youth aged 15-29 participated in the labour force, with a number of male (13.1 million) and female (7.0 million) youth among them. Their proportion within the total labour force represented 33.5 per cent. The youth labour force proportion was higher in rural areas, at 32.0 per cent, than in the urban areas, at 30.8 per cent.

Table 9.1 Proportion of youth labour force in total labour force, by age group, sex and area

9.2 Youth employment by age group

As shown in table 9.2, an estimated 17.9 million youth (89.4 per cent) were employed of the total 20.1 million youth labour force (table 9.1) aged 15–29 years, with large difference in numbers between male youth (at 12.0 million) and female youth (at 5.9 million).

<i>Table 9.2 Proportion of employed youth in total employment, by age group, sex and area</i>

Total	28.4	32.8	29.7	25.3	41.0	29.1	27.4	35.0	29.5

9.3 Youth unemployment by age group

Of the youth labour force population aged 15–29 (20.1 million-table 9.1), an estimated 2.1 million of them (10.6 per cent) were unemployed (table 9.3). The unemployed male youths (1.08 million) were larger than the female youths (1.05 million). The proportion of unemployed youth in total unemployment was smaller in rural areas (78.3 per cent) than in the urban areas (82.4 per cent). Overall, 79.6 per cent of total unemployed were youth.

<i>Table 9.3 Proportion of unemployed youth aged 15–29 in total unemployment, by age group, sex and area</i>

9.4 Youth unemployment rate

The youth unemployment rate is defined as the proportion of unemployed youth to the total persons in the youth labour force. As shown in table 9.5, the estimated youth unemployment rate was 10.6 per cent (8.2 per cent for males and 15.0 per cent for females). In urban areas, the results reveal a youth unemployment rate of 11.6 percent, with the higher rate for females 16.7 per cent compared with at 8.7 per cent for males, while the results reveal a youth unemployment rate of 10.2 per cent, with the higher rate for females, at 14.3 per cent, compared with 8.1 per cent for males in rural areas.

Table 9.5 Youth aged 15-29 unemployment rate, by age group, sex and area

Age group	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
15-19	10.4	20.0	12.7	11.5	14.2	12.5	10.7	17.7	12.7

National	3.0	5.9	4.0	3.3	8.9	4.9	3.1	6.7	4.2

9.5 Unemployed youth by duration of unemployment

As shown in table 9.6, less than half (46.9 per cent) but the largest share of the unemployed youth at the time of the survey had been unemployed for 1-6 months, followed by 21.0 per cent had been unemployed for 6-12 months, 12.5 per cent had been unemployed for 1-2 years at the time of survey. Only 6.8 per cent had been unemployed for two years or more.

Table 9.6 Unemployed youth aged 15–29, by duration in unemployment, sex and area (in 000)

Duration of unemployment	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
< 1 month	15.3	11.5	13.5	11.1	11.5	11.3	14.0	11.5	12.8
1-6 months	49.6	41.7	45.8	51.6	46.4	48.9	50.3	43.4	46.9
6-12 months	20.9	23.0	21.9	21.1	17.8	19.3	20.9	21.1	21.0
1-2 years	12.4	14.3	13.3	9.5	12.2	10.9	11.5	13.6	12.5
2 years and above	1.8	9.5	5.5	6.7	12.1	9.5	3.4	10.4	6.8
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

As indicated in table 9.7 below, the largest share of the unemployed youth for the long term (1-2 years or 2 years or more) had completed the tertiary education level (17.8 per cent and 11.2 per cent respectively), followed by those who had completed higher secondary school (14.4 per cent and 4.0 per cent) and then secondary school completed (11.2 per cent and 6.6 per cent). It was observed that, there was a positive relationship between level of education and duration of youth unemployment.

Table 9.7 Unemployed youth aged 15–29, by duration in unemployment, and education

Education	<1 month	1-6 month	6-12 month	1-2 years	2+ years	Total
None	23.5	44.5	16.9	11.1	4.1	100.0

Others	9.0	51.9	34.2	4.9	0.0	100.0
Total	12.8	46.9	21.0	12.5	6.8	100.0

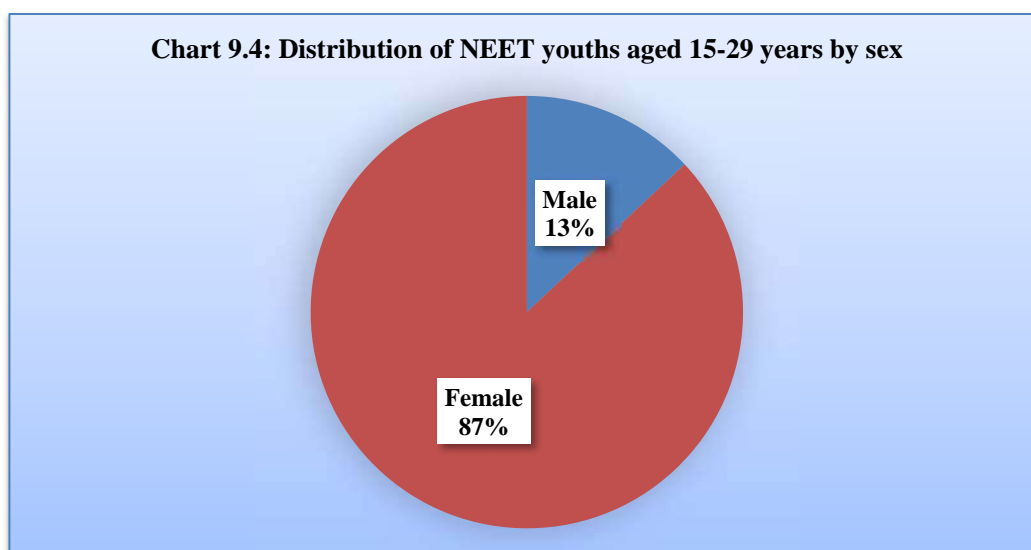

9.6 Youth not in Education, Employment or Training (NEET):

The share of youth not in education, employment or training (NEET) conveys the number of young persons not in education, employment or training as a percentage of the total youth population. It provides a measure of youth who are outside the educational system, not in training and not in employment, and thus serves as a broader measure of potential youth labour market entrants than youth unemployment, since it also includes young persons outside the labour force not in education or training.

NEET youth can be either unemployed or inactive and not involved in education or training. Young people who are neither in employment nor in education or training are at risk of becoming socially excluded- individuals with income below the poverty-line and lacking the skills to improve their economic situation.

This indicator is also a better measure of the current universe of potential youth labour market entrants compared to the youth inactivity rate, as the latter includes those youth who are not in the labour force and are in education, and thus cannot be considered currently available for work. More generally, a high NEET rate and a low youth unemployment rate may indicate significant discouragement of young people.

Given its usefulness in conveying valuable information on the labour market situation of a country's young population, it was included as one of the indicators proposed to measure progress towards the achievement of the Sustainable Development Goals (SDG), under Goal8 (Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all).

As shown in Chart 9.4, among the NEET youths, 13.0 per cent were male and the rest 87.0 per cent were females. A high NEET rate for young women suggests their engagement in household chores, and/or the presence of institutional barriers limiting female participation in labour markets.

Table 9.8: NEET youth aged 15-29, by age group, sex and area

(in 000)

Age group	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total

25-29	6.0	57.6	34.9	5.1	62.5	37.3	5.7	59.2	35.7
Total	8.5	50.2	29.9	7.4	47.8	29.5	8.1	49.4	29.8
Percent distribution of total NEET									
15-19	4.7	12.1	16.8	1.6	4.3	5.8	6.3	16.3	22.6
20-24	2.9	23.3	26.2	1.1	10.0	11.1	4.0	33.3	37.3
25-29	2.0	24.5	26.5	0.8	12.8	13.6	2.8	37.3	40.1
Total	9.6	59.9	69.5	3.5	27.1	30.5	13.0	87.0	100.0

As indicated in table 9.8, the largest share of the NEET youth were from the age group 25-29 (4.9 million or 40.1 per cent), followed by those who belongs to 20-24 age group (4.6 million or 37.3 per cent) and then 15-19 age group (2.8 million or 22.6 per cent). Of the total NEET youths, 69.5 per cent from the rural area and the rest 30.5 per cent from the urban areas. Overall, 29.8 per cent of the working age population aged 15-29 were not in education, employment or training.

As shown in Chart 9.5, NEET rate (NEET as % of working age population) varies widely by sex in each age group. It was represented 29.8 per cent for both sex, 8.1 per cent for male and 49.4 per cent for female within the youth aged 15-29 years of working age population.

Chapter 10

Earnings from employment

Bangladesh 2016-17

This chapter presents information on earnings from employment, including frequency of payment, average monthly income by occupation and industry, locality and gender. Income related to paid employment is the most comprehensive measure of the level of remuneration of workers in paid employment.

Chapter 10

Earnings from employment

This chapter presents information on earnings from employment, including frequency of payment, average monthly income by occupation and industry. For the survey, data on wages and salaries were collected only from paid employees and not from people who were self-employed or contributory family helper. All other forms of income (remittances, rental income, bank interest, etc.) received by paid employees were excluded. Wage and salary earnings can be of two types, in cash or in kind, and information was collected on both. Earnings paid in cash or by cheque or direct bank deposit was considered as cash earnings. Earnings in kind included the regular supply of food, clothing, housing, water, electricity, fuel, transport, etc. on a free or subsidized basis.

10.1 Frequency of payment of the paid employees

As shown in table 10.1 and chart 10.1, of an estimated 24.2 million paid employees, 56.7 per cent paid monthly, followed by 34.5 per cent were paid daily, 7.3 per cent paid weekly and 1.5 per cent paid on some other basis. Frequency of payment to the paid employees varies widely between sex and locality.

Chart 10.1: Mode of payment of paid employees

Table 10.2 reflects that, more than 95 per cent of the workers of the highly skilled occupations viz. Managers (97.1 per cent), Professionals (96.7 per cent) paid on a monthly basis, followed by Clerical Support Workers (94.0 per cent), other occupations (94.9 per cent) and Service and Sales Workers (80.6 per cent). Most of the workers paid on a daily basis were those in Skilled Agricultural, Forestry and Fisheries (61.6 per cent) and Elementary occupations (69.5 per cent).

Table 10.2 Employed population aged 15 or older, by occupation and frequency of wage payment

<i>Occupation</i>	<i>Daily</i>	<i>Weekly</i>	<i>Monthly</i>	<i>Others</i>	<i>Total</i>

10.2 Average monthly income by occupation & industry

As noted, information on income (wages and salaries) was analyzed from employees in their main job/activity, in cash and in kind. Where information on earnings in the main job was not paid on a monthly basis, it was converted into a monthly basis. All amounts were recorded in Bangladesh Taka.

As shown in table 10.3, the estimated average monthly income of paid employees in 2016-17 was Tk. 13,258. On average, males earned, at Tk. 13583 which was slightly more than what female employees earned, at Tk 12254. In the urban areas, managers earned the highest average monthly income, at Tk. 41473, followed by professionals, at Tk. 29349. In some occupations, the difference in the earnings between male and female employees was wide, particularly for Skilled Agricultural, Forestry and Fisheries and Elementary Occupations. In general, the average monthly income of employees in urban areas (Tk. 15912) was higher than in rural areas (Tk. 11608).

10.3 Average monthly income by age group

In general, as shown in table 10.5, employees aged 45-54 in each area earned the highest average monthly income (Tk. 15446) among all age groups. The data indicates the lowest average monthly income (Tk. 10831) was among the youngest (15–24) in both urban and rural areas and monthly income (Tk. 11580) was among the eldest (65+) in both urban and rural areas.

Table 10.5 Average monthly income from employment (wage/salary), by age group sex and area

Trends of average earnings of wage employees

Chapter 11

Working hours and time-related underemployment

Bangladesh 2016-17

This chapter presents the findings on the working hours of employed persons, excessive hours of work per week and time-related underemployment. Measuring the levels and trends in hours worked for different groups of employed persons is important for monitoring working and living conditions, as well as analyzing economic activity.

Chapter 11

Working hours, excessive hours and time-related underemployment

This chapter presents the findings on the working hours of employed persons, excessive hours of work per week and time-related underemployment. The survey collected detailed information on hours of work among employed persons aged 15 years or older. Respondents were asked about the number of hours actually worked in the seven days prior to the survey interview.

11.1 Working hours

As reflected in chart 11.1, employed persons worked an estimated average of 48 hours a week in 2016-17, with male employees working more hours on average, at 52 hours, than female employees, at 38 hours. The average working hours were fewer in rural areas, at 46 hours, than in urban areas, at 51 hours and in city corporation areas, at 56 hours. Both male and female employees in the urban areas worked more hours per week than their counterparts in the rural areas.

By broad economic sector (table 11.1), the sectors with highest average of hours per week were industry sector, at 54 hours, followed by service sector, at 53 hours. The lowest average of hours worked in a week was found in the agriculture sector, at 39 hours.

Table 11.1 Average number of hours employed persons worked per week, by sector, sex and area

Status in employment	Rural			Urban			Bangladesh

11.2 Excessive hours of work

Excessive work defines as the states that in all establishments of any nature, the number of hours worked by workers of either sex cannot exceed eight hours per day or 48 hours per week. The indicator of employment in excessive working time provides information about the share of employed persons whose hours of worked.

As table 11.6 indicates, around half (49.8 per cent) of total employed workers in all economic activities worked more than 48 hours per week. More of them were male, at 63.5 per cent, than female, at 18.7 per cent. And more of the male worked in urban areas, at 71.6 per cent, than in rural areas, at 60.2 per cent.

Table 11.6 Persons (% of total employed) with excessive hours of work per week, by occupations, sex and area

Occupation	Rural			Urban			Bangladesh

By occupation group, more workers with a work week longer than 48 hours were found in Plant and Machine Operators, and Assemblers, at 80.0 per cent, followed by 77.2 per cent in Service and Sales workers. The majority of workers with excessive hours in urban areas were in Plant and Machine Operators, and Assemblers, at 84.0 per cent, followed by Service and Sales Workers, at 79.2 per cent. In the rural areas, more workers with a work week longer than 48 hours were in Plant and Machine Operators, and Assemblers occupations (77.7 per cent), followed by Service and Sales Workers (75.8 per cent).

Table 11.7 below indicated that, by broad economic sector, the largest proportions of workers with the longer hours work were in the Industry sector, at 69.1 per cent, while workers in the Service sector, at 64.1 per cent, had excessively long weeks. In urban areas, the industry sector had the largest share, at 75.0 per cent of employed workers with excessive work weeks. In rural areas also, the Industry sector had the largest share of workers with excessive work weeks at 65.2 per cent, followed by the Service sector (64.0 per cent) and agriculture sector (26.2 per cent).

By education attainment, more workers with a work week longer than 48 hours were found in higher secondary and primary completed workers, at 53.6 per cent, and by 53.4 per cent respectively. The majority of workers with excessive hours in urban areas were in secondary and primary completed workers, at 69.2 per cent, followed by 67.9 per cent (table 11.10).

11.3 Time-related underemployment

The time-related underemployment rate is defined as the percentage of employed persons who worked less than 40 hours during the reference period and were willing and available to work more hours than what they actually worked. It includes all employed persons whose working time in all jobs is “insufficient in relation to an alternative employment situation in which the person is willing and available to engage”.

The criteria for defining time-related underemployment are:

- i. willingness to work additional hours;
- ii. availability to work additional hours and
- iii. having worked less than a threshold of working hours (40 hours per week), which is the normal number of working hours per week– eight hours per day, for five days.

11.3.1 Underemployed by type and reasons for looking for job

Of all employed persons who worked less than 40 hours in a week in the country in 2016-17, an estimated 1.5 million employed persons (2.4 per cent) were looking for new/additional jobs (table 11.11). Of them, 1.0 million were employed male (2.2 per cent) and 0.5 were employed female (2.9 per cent). And the majority of them lived in rural areas, at 1.1 million persons (2.6 per cent), compared with 0.3 million persons (1.9 per cent) in urban areas.

<i>Table 11.11 Persons looking for additional hours/new work by underemployed (40 hours), sex and area (in 000)</i>									
Looking for additional work /new job	Rural			Urban			Bangladesh

Total employed	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Of all employed persons who worked less than 40 hours in a week in the country in 2016-17, an estimated 1.5 million employed persons were looking for new/additional jobs (table 11.12). Of them, 1.0 million were employed male and 0.5 were employed female.

By reasons for looking for job (table 11.12) by the underemployed persons, around half of the time-related underemployed persons (49.2 per cent) were in “to have better paid job/activity”, followed by “to work more hours” (36.8 per cent). This pattern was reflected in both rural and urban areas.

Table 11.12 Underemployed (less than 40 hours) by reason of looking for additional/new job, sex and area

11.3.2 Time-related underemployment by age group and sex

Information on employed persons who had worked less than 40 hours in the week prior to survey was then used to assess time-related underemployment. Of all employed persons in Bangladesh in 2016-17, an estimated 0.66 million employed persons (45.2 per cent) were underemployed in the age group 15-29 years (table 11.13) and 0.79 million (53.8 per cent) were in the age group 30-64. The proportion of underemployed with the total employed persons was higher in youths (3.7 per cent), followed by Adults (1.9 per cent) and old age (0.6 per cent) employed persons.

11.3.3 Time-related underemployment by sector

By broad economic sectors, (chart 11.4) almost two-third of the time-related underemployed (less than 40 hours) persons was engaged in agriculture (61.6 per cent), while more than one-fourth worked in service sector (28.2 per cent) and the rest 10.3 per cent was engaged in the industry sector.

The distribution of the time related underemployed persons by area and sex is illustrated in table 11.14 for each economic sector of the country. Overall, 2.4 per cent of the total employed persons were time related underemployed, of them 3.7 per cent of the total employed persons in the agriculture sector were underemployed; 1.2 per cent of the total employed persons in the industry sector were underemployed and 1.7 per cent of the total employed persons in the service sector were underemployed;

11.3.4 Time-related underemployment by Occupation

Table 11.15 reflected the proportion of underemployment by occupation and sex for both urban and rural areas. The majority of the time-related underemployed persons were worked as professionals (5.3 per cent), followed by skilled Agricultural, Forestry and Fisheries at 3.5 per cent, Elementary Occupations, at 2.8 per cent of the total employment in that particular occupations.

<i>Table 11.15 Persons in time-related underemployment (less than 40 hours), by occupation, sex and area</i>

11.3.5 Time-related underemployment by education

Table 11.16 highlighted the proportion of time-related underemployment by education attainment of the employed population. It shows that majority of the time-related underemployed persons were belongs to Higher Secondary education category, at 3.7 per cent, followed by Others at 3.0 per cent. Females were suffering more (2.9 per cent) than that of male counterpart (2.2 per cent). Time-related underemployment rate was higher in rural areas (2.6 per cent) than urban areas (1.9 per cent).

Chapter 12

Quality and stability and social security coverage

Bangladesh 2016-17

This chapter presents the survey findings regarding:
(i) quality and stability of employment, including the proportions of own-account workers and contributing family workers in total employment and employment by contract type, (ii) social security, and (iii) precarious work.

Chapter 12

Quality, stability and social security coverage

This chapter presents the survey findings regarding: (i) quality and stability of employment, including the proportions of own-account workers and contributing family workers in total employment and employment by contract type, (ii) social security, such as the proportions of paid employees contributing to any pension or retirement fund and the proportions of paid employees benefiting from annual or sick leave, and (iii) precarious work, such as seasonal, occasional or substitute work.

12.1 Quality and stability of employment

The proportion of own-account workers and contributing family workers in total employment is the percentage of all employed persons who are own-account or contributing family workers. This indicator provides information regarding the proportion of workers whose status in employment may place them at a higher degree of economic risk and vulnerability than other employed persons. These two status groups are considered as vulnerable because such workers are unlikely to have formal employment arrangements or access to benefits or social protection programs and they are more at risk to the effects of economic cycles.

Own-account workers worked on their own account or with one or more partners as self-employed and had not engaged any employee's on a continuous basis to work for them during the reference period. The partners may or may not be members of the same family or household. Contributing family workers are those who hold a self-employment job in a market oriented establishment operated by a related person living in the same household, who cannot be regarded as partners.

According to the findings (table 12.1), an estimated 55.8 per cent of all employed persons in 2016-17 were own-account or contributing family workers (in vulnerable employment). More than half of the employed males (50.6 per cent) and nearly seven of every ten employed females (67.7 per cent) were in vulnerable employment.

Across age groups, the largest proportion of own-account and contributing family workers in total employment was 69.9 per cent among persons 65 years or older, followed by 59.2 per cent among those aged 30–64 and 46.2 per cent among those aged 15–29. The proportions varied largely between urban areas (40.4 per cent) and rural areas (61.8 per cent).

Employees were asked whether they were employed on the basis of a written contract or oral agreement and whether the contract or agreement was of limited, unlimited or unspecified duration. Table 12.2 reflects that more than two third of 16.8 million (or 69.4 per cent) of all employees worked with only an oral employment agreement. Of the 7.4 million employees with a written contract, nearly 1.0 million of them were of limited duration. Around 6.4 million employees (26.5 per cent) had a written contract with unlimited duration.

Employees those had limited contract, were asked to answer the reasons behind their limited contract. The highest answer for that is specific task, at 31.6 per cent, followed by Occasional / daily work day work, at 28.0 per cent and Seasonal work, at 21.0 per cent. Training was accounted for only 5.1 per cent of them; government special programme was accounted for 6.2 per cent employees (Table 12.3 below).

12.2 Social security

Employees were also asked if their employer contributed to any pension or retirement fund for them. As indicated in table 12.4, of all paid employees, 10.6 percent of them had an employer who contributed to a pension scheme or retirement fund. The proportion of paid employees with a contribution to any pension or retirement fund was larger in the urban areas (14.5 per cent) than in rural areas (8.2 per cent). Specifically, in those urban areas, one fifth (20.8 per cent) of the employees aged 30-64 had a contribution to any pension or retirement fund, compared with only 5.5 per cent in the 15-29 age group (table 12.4).

Employees were asked whether they were entitled to either paid annual leave or paid sick leave in case of illness or injury. According to the responses (table 12.6), 29.7 per cent of them were allowed any paid sick leave, 36.1 per cent were female and 27.7 per cent were male. The proportions varied largely between urban areas (47.6 per cent) and rural areas (18.6 per cent). Between age groups, 30.3 per cent of employees aged 30–64 compared with 29.6 per cent of employees aged 15–29.

12.3 Precarious work

Distribution of paid employees by type of contract is provided in table 12.10 below. Employees were asked if they have any written contract (if any). Of the total paid employees, 4.1 per cent of them had precarious work (3.9 per cent of them male and 4.8 per cent female). More of them lived in urban areas, at 5.2 per cent, than in rural areas, at 3.5 per cent. Among the total paid employees, 69.4 per cent had oral contract or even don't know about their contract.

As shown in chart 12.4, the distribution of total precarious workers by sex and industry sector, more than half of the male precarious workers were engaged in service sector (52.5 per cent), whereas the highest proportion was in the industry sector (54.3 per cent) for the females and overall, 49.0 per cent of the precarious workers were engaged in the service sector, followed by industry sector (46.4 per cent) and agriculture sector (4.7 per cent).

Chapter 13

Safety of work

Bangladesh 2016-17

This chapter presents the data on the work-related injuries and illness that workers had experienced in the 12 months prior to the survey, including type of injury or illness and working days lost as well as types of hazards and their frequency. Occupational injury and illness is defined as any personal injury resulting from a work-related accident. To identify hazard work, each employed person was asked a series of questions on their exposure at work.

Chapter 13

Safety of work

This chapter presents the data on the work-related injuries and illness that workers had experienced in the 12 months prior to the survey, including type of injury or illness and working days lost as well as types of hazards and their frequency.

13.1 Occupational injuries and illnesses

Occupational injury and illness is defined as any personal injury resulting from a work-related accident. As shown in table 13.1, an estimated 1.9 million persons (3.1 per cent of total employed) aged 15 or older experienced an occupational injury and illness sometime during the 12 months prior to the survey; of them, 1.6 million were male (3.8 per cent of total male employed) and 284 thousand were female (1.5 per cent of total female employed). More than two times as many persons aged 30–64 (67.3 per cent) reported an injury or illness in the previous year than younger workers (29.5 per cent). Among injured women, the rate for younger women (44.3 per cent) was higher than that of male (29.6 per cent) in urban areas whereas in rural areas it was male (28.0 per cent) and females (31.2 per cent).

Time lost in days is an indicator that measures the consequences of occupational injuries. It gives a quantifiable measure of the impact of the injuries that is comparable across cases, and is useful for designing targeted prevention mechanisms and for estimating the cost of occupational injuries. As table 13.2 indicates, the majority of persons reporting any occupational injury or illness in the previous year also reported that they had lost one working days (25.8 per cent), followed by a loss of three days (24.9 per cent).

Table 13.3 indicates that the largest proportion of occupational injuries occurred to those who engaged as Craft and Related Trades Workers (5.7 per cent), followed by Elementary Occupations (5.6 per cent), Plant machine operators and assemblers (5.2 per cent). Overall, 3.1 per cent of the employed persons reported occupational injuries and illnesses in the previous 12 months. Male (3.8 per cent) employed persons were suffering from injuries four times than that of females (1.5 per cent). Male employed persons of both urban and rural areas were more deteriorated than female counterparts.

Table 13.4 indicates that the largest proportion of occupational injuries occurred to those who engaged in industry sector (7.0 per cent), followed by service sector (2.6 per cent) and agriculture sector (1.6 per cent). The proportion of occupational injuries and illnesses in the previous 12 months for both male (7.2 per cent) and females (6.4 per cent) were worsen in the industry sector.

Table 13.4 Number and rate of reported occupational injuries and illnesses in the previous 12 months, by sector, sex and area

Sector	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total

13.2 Frequency of injuries

Those who experienced injuries during last 12 months were asked questions of the occurrences of the incidence. Overall, out of 1.9 million of the injured persons, 29.2 per cent persons aged 15 or older who reported experiencing a work-related injury for once in the 12 months prior to the survey (table 13.5), about one fourth (24.5 per cent) cited twice.

Table 13.5 Occupational injuries and illnesses in the previous 12 months and rate, by frequency of injury, sex and area

13.3 Type of hazards work

Each person in the sample households was asked a series of questions on their exposure at work and multiple responses were allowed. Table 13.6 reflected that the larger proportions in cited exposure to dangerous tools (6.9 per cent), followed by Chemicals/explosives (4.0 per cent), Dust, fumes, noise or vibration (4.0 per cent), Work in water/pond/river (2.1 per cent), work underground or at heights (1.9 per cent), Fire, gas, flames (1.6 per cent). In comparison, of the total employed persons, proportion of the workers in rural areas cited exposure to any of the types of exposure at work (12.8 per cent) was higher than in urban areas (4.5 per cent). Male employed persons were more vulnerable (more than five) than that of female counterparts.

Table 13.6 Rate of reported exposure at work, by type of exposure, sex and area

Type of exposure at work	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total

Total (any of the above)	11.3	1.5	12.8	3.6	0.9	4.5	14.9	2.4	17.2

As shown in table 13.7, among the 60.8 million employed, an estimated 1.5 million persons (2.5 per cent of total employed persons) aged 15 or older experienced an abused sometime during the 12 months prior to the survey; of them, 857 thousand (2.0 per cent) were male and 643 thousand (3.4 per cent) were female. The rate of any form of abuse in urban areas (1.7 per cent) was higher than rural areas (4.4 per cent).

Most of them (88.4 per cent) reported that they were constantly shouted / insulted, whereas 7.4 per cent were beaten/physically hurt, and 5.5 per cent were sexually abused. The distribution of sexually abused for females was as high as 10.5 per cent among the female employed and the rate was 1.7 per cent for the male employed. The sexual abuse rate for female was too high in urban (0.2 per cent) areas than rural (0.1 per cent) areas with respect to total employed. The distribution by type of abuse is provided below.

Table 13.7 Number and rate of reported abused, by type of abuse, sex and area (in 000)

Abused type	Rural			Urban			Bangladesh

Sexually abused	0.0	0.2	0.1	0.0	0.7	0.2	0.0	0.4	0.1
Other abuse	0.1	0.0	0.1	0.1	0.0	0.1	0.1	0.0	0.1
Total	1.9	1.3	1.7	2.3	10.1	4.4	2.0	3.4	2.5

As reflected in Chart 13.1, most of the abused employed (88.4 per cent) reported that they were constantly shouted/insulted, followed by 7.4 per cent beaten/physically hurt, 5.5 per cent sexually abused and the rest 3.2 per cent were abused by other type.

Table 13.8 reflected that an Industry and Service sector were more vulnerable to abuse to the employees with highest 651 and 656 thousand persons (43.5 per cent and 43.7 per cent of total abused persons) aged 15 or older experienced an abused sometime during the 12 months prior to the survey, followed by 192 thousand (12.8 per cent) in the agriculture sector. The proportion of abused persons to the total employed is more than three times in urban (4.4 per cent) areas than rural (1.7 per cent) areas.

<i>Table 13.8 Number and rate of reported abused, by sector, sex and area</i>									
Abused type	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Agriculture	126	45	170	17	5	22	143	49	192

Abused as % of total employed									
Agriculture	0.4	0.3	0.4	0.1	0.1	0.1	0.3	0.3	0.3
Industry	0.8	0.6	0.8	0.8	4.8	1.9	0.8	1.7	1.1
Service	0.7	0.3	0.5	1.4	5.2	2.5	0.9	1.5	1.1
Total abused	1.9	1.3	1.7	2.3	10.1	4.4	2.0	3.4	2.5
Total employed	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Of the total abused, the proportion of abused persons is prominent in Industry sector (39.8 per cent for male and 48.3 per cent for female), followed by Service sector (39.8 per cent for male and 48.3 per cent for female) and lowest in agriculture sector.

Chapter 14

Equal opportunities

Bangladesh 2016-17

This chapter deals with equal opportunity indicators that help to monitor the progress of its development achievements. It presents the survey findings for the female share of employment. The survey relied on monitoring occupational segregation of the female share of employment and the share of women in wage employment in the non-agriculture sector.

Chapter 14

Equal opportunities

This chapter presents the survey findings for the female share of employment. Equal opportunity indicators help the Government to monitor the progress of its development achievements. To look at the female share of employment, the survey relied on four statistical indicators used for such monitoring: occupational segregation (within the major groups of the International Standard Classification of Occupations), the female share of employment in BSCO middle and senior management groups, the female share of employment by major occupational group and the share of women in wage employment in the non-agriculture sector.

14.1 Occupational segregation of the employed persons

Occupational segregation provides information on the tendency for women and men to work in different occupations; in this indicator, “occupation” refers to the main tasks and duties. The indicator sheds light on the extent to which women and men benefit from different opportunities in the work life.

According to the findings presented in table 14.1, the largest proportion of female employment was in skilled agriculture Forestry and Fisheries work (51.7 per cent), followed by craft and related trade work (17.5 per cent) then elementary occupations (15.8 per cent). For males, the highest proportion is in skilled agriculture Forestry and Fisheries work (23.8 per cent), followed by sales and service work (21.6 per cent), then elementary occupations (17.9 per cent) and craft and related trade work (16.9 per cent).

Table 14.1 Occupational segregation of the employed persons aged 15 years or older, by sex and area (in 000)

Occupation-BSCO	Male			Female

14.2 Female share of employment in high-status occupations

The female share of employment in senior and middle management refers to the proportion of females in total employment in the BSCO-2012 category 11 (legislators and senior officials) and category 12 (corporate managers). This indicator provides information on the proportion of women who were employed in decision-making and management roles in government, in large enterprises and institutions. BSCO-2012 sub major group 13, of general managers, was not included in this indicator because it primarily includes managers of small enterprises.

Regarding high-status occupations that the survey considered, overall, 10.4 per cent of the female employment aged 15 or older were engaged in high-status occupations, 12.3 per cent female share of employment was as chief executives, senior officials and legislators whereas female share of employment as administrative and commercial managers was only 9.7 per cent.

Table 14.2: Female share of employment aged 15 or older in high-status occupations, by broad sector (in '000)

Sub-major group of BSCO	Agriculture	Industry	Service	Total

Other Occupations	3.7	8.5	5.4	96	56	152	4	5	8
Total	32.1	27.0	30.7	43885	16943	60828	14076	4570	18646

Female share of employment by occupations for rural (32.1 per cent) and urban (27.0) areas varies slightly (table 14.2). Overall, 30.7 per cent female share of employment was found in 2016-17.

14.4 Share of female in wage employment in non-agriculture sector

The non-agriculture sector refers to all economic activities excluding agriculture. Industry includes mining and quarrying, manufacturing, construction, electricity, gas and water. Services includes wholesale and retail trade, restaurants and hotels, transport, storage, communications, financing, insurance, real estate, business services, and community, social and personal services.

The share of women in wage employment aged 15 or older in the non-agriculture sector is an important measure of decent work and one that is also used to measure progress towards gender equality. According to the survey findings (table 14.4), the estimated share of women in wage and salaried employment outside the agriculture sector in 2016-17 was 26.9 percent as a whole, 22.5 per cent in rural areas and 32.2 per cent in urban areas.

Table 14.4 Share of female in wage employment of persons aged 15 or older in the non-agriculture sector, by area
(in 000)

Occupation	Female share (%)			Both sex			Female			%
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total

Total	22.5	32.2	26.9	10573	8918	19491	2378	2873	5251	100.0

The share of women in wage employment aged 15 or older in the non-agriculture sector is shown in Chart 14.2 below. The estimated share of women in wage and salaried employment outside the agriculture sector was 26.9 percent as a whole, 22.5 per cent in rural areas and 32.2 per cent in urban areas.

Chapter 15

Forms of work

Bangladesh 2016-17

This chapter looks at the characteristics of the population aged 15 years or over by their various forms of work. Forms of work are identified on the basis of the intended destination of the production and the nature of transaction, as follows:

- (a) Own-use production work
- (b) Employment work
- (c) Unpaid trainee work
- (d) Volunteer work

Chapter 15

Forms of Work

This chapter looks at the characteristics of the population aged 15 years or over by their various forms of work. The QLFS 2016-17 questionnaire is developed in such a way that BBS can have some statistics on the types of work done by the persons aged 15 years and over and regular statistics on the various forms of work may be generated in the future.

The term **Work** is defined as any activity performed by persons of any sex and age to produce goods or to provide services for use by others or for own use.

- (a) Work is defined irrespective of its formal or informal character or the legality of the activity.
- (b) Work excludes activities that do not involve producing goods or services (e.g. begging and stealing), self-care (e.g. personal grooming and hygiene) and activities that cannot be performed by another person on one's own behalf (e.g. sleeping, learning and activities for own recreation).
- (c) The concept of work is aligned with the General production boundary as defined in the System of National Accounts 2008 (2008 SNA) and its concept of economic unit that distinguishes between:
 - i. market units (i.e. corporations, quasi-corporations and household unincorporated market enterprises);
 - ii. non-market units (i.e. government and non-profit institutions serving households); and
 - iii. households that produce goods or services for own final use.
- (d) Work can be performed in any kind of economic unit.

15.1 Forms of work

Four **forms of work** are identified for separate measurement. These forms of work are identified on the basis of the intended destination of the production (for own final use; or for use by others, i.e. other economic units) and the nature of the transaction (i.e. monetary or non-monetary transactions, and transfers), as follows:

- (a) *own-use production work* comprising production of goods and services for own final use;
- (b) *employment work* comprising economic activities/work performed for others in exchange for pay or profit or production of goods for own-use;
- (c) *unpaid trainee work* comprising work performed for others without pay to acquire workplace experience or skills;
- (d) *volunteer work* comprising non-compulsory work performed for others without pay;

The reference period used for the QLFS 2016-17 for each form is based on the intensity of participation and working time arrangements:

- (a) seven days or one week, for *employment* and *unpaid trainee work*;
- (b) four weeks or one calendar month, for *own-use production of goods*, *unpaid trainee work* and *volunteer work*;
- (c) seven days or one-week period, for *own-use provision of services*.

15.2 Own-use production work

Persons in own-use production work are defined as all those of working age who, during a short reference period (1 month for production of goods and 1 week for provision of services), performed any activity to produce goods or provide services for own final use, where: “any activity” refers to work performed in the various activities for a cumulative total of at least one hour. The various forms of work are measured with respect to a short reference period. *Own-use production work* comprising the following:

- (i) production of goods for own final use and
- (ii) Provision of services for own final use.

(i) Own-use production of goods for own final use

Own-use production of goods (within the 2008 SNA production boundary) covers:

- i. producing and/or processing for storage agricultural, fishing, hunting and gathering products;
- ii. collecting and/or processing for storage mining and forestry products, including firewood and other fuels;
- iii. fetching water from natural and other sources;
- iv. manufacturing household goods (such as furniture, textiles, clothing, footwear, pottery or other durables, including boats and canoes);
- v. building, or effecting major repairs to, one’s own dwelling, farm buildings, etc.;

In terms of the distribution of the working age population engaged in production of goods for own final use in the previous 1 month by labour force status, sex and area for each type of work is provided (table 15.1 & chart 15.1 below). The largest proportion was by Own plot, farm for own consumption workers, at 18.2 million or 16.7 per cent of the working age population, followed by Fetch water or firewood for own consumption, at 4.9 per cent. The proportion was higher for females (20.5 per cent) than that of male (12.8) counterparts of the own plot, farm for own consumption workers.

Table 15.1: Persons aged 15 or older engaged in own use goods in the previous 1 week, by labour force status, sex and area (in 000)

(ii) Provision of services for own final use

Provision of “services” (beyond the 2008 SNA production boundary but inside the General production boundary) covers:

- i. household accounting and management, purchasing and/or transporting goods;
- ii. preparing and/or serving meals, household waste disposal and recycling;
- iii. cleaning, decorating and maintaining one’s own dwelling or premises, durables and other goods, and gardening;
- iv. childcare and instruction, transporting and caring for elderly, dependent or other household members and domestic animals or pets, etc.;

Table 15.2 below reflected the distribution of the working age population engaged in provision of services for own final use in the previous 1 week by labour force status, sex and area for each type of work is provided.

Table 15.2: Distribution of persons aged 15 or older engaged in own use services in the previous 1 week, by labour force status, sex and area

Total	22.4	50.0	36.3	23.7	50.2	37.1	22.8	50.0	36.5

Table 15.2 indicated that, the largest proportion was by Cleaning clothes and dishes workers, at 51.3 per cent of the working age population, followed by shopping, at 51.1 per cent. As regards the cooking for own use, 44.3 per cent of the working age population engaged in cooking work, whereas it was 85.2 per cent for females and only 2.6 per cent male engaged in cooking work. The proportion of female own use service worker was much higher than that of male counterpart in almost all the categories (except shopping work).

The distribution of the working age population engaged in provision of services for own final use in the previous 1 week by education attainment, sex and area for each type of work is provided in table 15.3 given above. About one fifth of the female working age population engaged in Shopping, it was 30.5 per cent in urban areas and 17.2 per cent in rural areas. A clear negative correlation is observed between the type of services provided and the level of education (except shopping work).

As reflected in table 15.4, employed persons worked an estimated average of 12 hours a week in 2016-17 for own-use provision of services, with male employees working less hours on average, at 8 hours, than female employees, at 21 hours. By sex, the average working hours were significantly different both in rural and urban areas.

Table 15.4: Average hours spent by persons aged 15 or older engaged in own use services in the previous 1 week, by labour force status, sex and area

Labour force status	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Employed	8	21	13	8	18	11	8	21	12
Unemployed	11	24	18	12	22	18	11	23	18
Not in LF	11	29	26	11	28	25	11	28	26
Total	9	26	18	9	25	17	9	25	18

Chart 15.3 below indicated that average working hours differs significantly by labour force status and sex. By sexes, average working hours varies significantly (females worked three times more than male counterparts) for both in the urban and rural areas.

By labour force status, the highest average of working hours per week for the females was found in Not in Labour Force category, at 29 hours. The second-highest average hours per week was in Unemployed females, at 24 hours, followed by Employed females, at 21 hours. In contrast, for males, those in Not in Labour Force and Unemployed categories was found, at 11 hours and the smallest average of working hours for males in Employed category, at only 8 hours.

Table 15.5: Average hours spent by persons aged 15 or older engaged in own use services in the previous 1 week, by age group, sex and area

Labour force status	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
15-29	9	24	18	8	23	17	9	24	18
30-64	9	27	18	9	27	18	9	27	18
65+	8	15	11	8	15	10	8	15	11
Total	9	26	18	9	25	17	9	25	18

As indicated in table 15.5, by age group, the highest average of working hours per week was found in both the young and adult age group 15-29 and 30-64, at 18 hours, followed by old age group 65+ years, at 11 hours. By sex, the working hours per week for females (25 hours) was found almost three times higher than male (9 hours) counterparts.

15.3 Employment work

Persons in employment are defined as all those of working age who, during a short reference period, were engaged in any activity to produce goods or provide services for pay or profit or engaged in any activity to produce goods for own consumption. Based on their main intention of work, the employed population was categorized into two viz.

1. Pay or profit
2. Own-use production of goods

Almost one-third 34.0 per cent (8.6 million) employed persons aged 15 or older worked for own use production of goods in the agriculture sector as their main intention of work, followed by very little in the services (0.1 per cent) and industry sector at 0.1 per cent (Table 15.6) below. Overall, a total of 14.6 per cent of the employed persons engaged in for own use production of

goods as their main intention of work. According to the ILO in its 19th ICLS resolution, employment work is defined as work performed for others in exchange for pay or profit and using that definition employment work consist of 51.9 million or 85.4 per cent of the working age population. In agriculture sector, 64.1 per cent of the work performed for others in exchange for pay or profit.

Table 15.6: Employed population aged 15 or older, by intention of work, and economic sector (in 000)

Type of employment work	Sector			
	Agriculture	Industry	Service	Total
Pay or profit	15840	12416	23702	51958
Own-use production of goods	8853	8	9	8870
Total	24693	12424	23711	60828
	Column %			
Pay or profit	64.1	99.9	100.0	85.4
Own-use production of goods	35.9	0.1	0.0	14.6
Total	100.0	100.0	100.0	100.0

As shown in Table 15.7, of the 60.8 million employed persons aged 15 years or older, 51.9 million of them (85.4 per cent) were in employment or engaged in economic activity for pay or profit; 12.5 million of them were females.

Table 15.7: Employed population aged 15 or older, by intention of work, sex and area (in 000)

Type of employment work	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
	Number

Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Those who were working for own use production of goods; 40.2 per cent of them were females among female employed; only 8.5 per cent of the male were working for own use production of goods as their main intention of work (Chart 15.5).

15.4 Unpaid trainee/Apprentice work

Persons in unpaid trainee work are defined as all those of working age who, during a short reference period, performed any unpaid activity to produce goods or provide services for others, in order to acquire workplace experience or skills in a trade or profession, where:

- “short reference period” is usually for 1 week;
- “any activity” refers to work for at least one hour;
- “unpaid” is interpreted as the absence of remuneration in cash or in kind for work done or hours worked; nevertheless, these workers may receive some form of support, such as transfers of education stipends or grants, or occasional in cash or in kind support (e.g. a meal, drinks);
- production “for others” refers to work performed in market and non-market units that are owned by non-household or non-family members;
- acquiring “workplace experience or skills” may occur through traditional, formal or informal arrangements whether or not a specific qualification or certification is issued.

Included in unpaid trainee work are persons in:

- traineeships, apprenticeships, internships or other types of programmes according to national circumstances, when their engagement in the production process of the economic unit is unpaid; and
- unpaid skills training or retraining schemes within employment promotion programmes, when engaged in the production process of the economic unit.

Excluded from unpaid trainee work:

- periods of probation associated with the start of a job;
- general on-the-job or lifelong learning while in employment, including in market and nonmarket units owned by household or family members;
- orientation and learning while engaged in volunteer work;
- learning while engaged in own-use production work.

As indicated in table 15.8, of the 109.1 million persons aged 15 years or older, 129 thousand of them were engaged in Apprentice work/unpaid; 102 thousand of them were males and the rest 18 thousand females. Almost 91.7 per cent of the was in the younger age groups, 15–29 years old, whereas only 8.3 per cent of them from the age group 30-64 years. Overall, only 0.1 per cent of the 109.1 million working age population was engaged in apprentice/unpaid trainee work.

Majority of the estimated Apprentice /unpaid trainee workers, 98.4 per cent or 127 thousand at the time of the survey was literate (table 15.10) whereas only 1.6 per cent or 2 thousand of them was not literate. About 70 thousand of the apprentice / unpaid trainee workers were in the rural areas; it was 59 thousand in the urban areas.

15.5 Volunteer work

Volunteerism plays an important role in the economic growth and poverty alleviation in Bangladesh. Reliable and up-to-date data on volunteerism is likely to help the planning and programme towards the development of this important sector. Persons in volunteer work are defined as all those of working age who, during a short reference period, performed any unpaid, non-compulsory activity to produce goods or provide services for others, where:

- (a) “any activity” refers to work for at least one hour;
- (b) “unpaid” is interpreted as the absence of remuneration in cash or in kind for work done or hours worked; nevertheless, volunteer workers may receive some small form of support or stipend in cash, when below one third of local market wages (e.g. for out-of-pocket expenses or to cover living expenses incurred for the activity), or in kind (e.g. meals, transportation, symbolic gifts);
- (c) “non-compulsory” is interpreted as work carried out without civil, legal or administrative requirement, that are different from the fulfilment of social responsibilities of a communal, cultural or religious nature;
- (d) production “for others” refers to work performed:
 - i. through, or for organizations comprising market and non-market units (i.e. organization based volunteering) including through or for self-help, mutual aid or community-based groups of which the volunteer is a member;
 - ii. for households, other than the household of the volunteer worker or of related family members (i.e. direct volunteering).

Excluded from volunteer work:

- (a) community service and work by prisoners ordered by a court or similar authority, compulsory military or alternative civilian service;
- (b) unpaid work required as part of education or training programmes (i.e. unpaid trainees);
- (c) work for others performed during the working time associated with employment, or during paid time off from an employee job granted by the employer.

A total of 10.7 million people is found to have volunteered at least once during previous month of the survey year 2016-17 (table 15.11). Of all volunteers, 68.1 per cent in rural areas and the remaining 31.9 per cent urban areas. Compared to working age population, urban volunteering (10.6 per cent) is higher than rural (9.4 per cent).

Table 15.11: Persons aged 15 or older engaged in Volunteer work in the previous 1 month, by labour force status, sex and area (in 000)

The survey reveals that, among the 10.6 million volunteers, male volunteers are as many as 7.8 million or 73.3 per cent and female volunteers are 2.8 million or 26.7 per cent (chart 15.6).

A total of 10.6 million people is found to have volunteered at least once during previous month of the survey year 2016-17. Distribution of volunteers as percent of total working age population by labour force status and sex is provided in Chart 15.7 below:

By labour force status, 16.1 per cent of the total employed persons engaged in the volunteer work, followed by 10.6 per cent of the unemployed persons and only 8.4 per cent of the persons outside the labour force was engaged in the volunteering (chart 15.7).

Nearly 24.4 per cent of all volunteers have reported possessing no formal education. On the other hand, those having primary education are 22.6 per cent as compared to 43.8 per cent with secondary and post-secondary level education and 8.6 per cent with tertiary level education (table 15.12).

The rate of male volunteers was 14.4 per cent while the rate was 5.2 for the female counterparts. It was 9.4 per cent for the rural areas (14.2 per cent for male and 4.7 per cent for female) and 10.6 for the urban areas (15.0 per cent for male and 6.4 per cent for female). Overall, 14.4 per cent male and 5.2 per cent female of the working age population was engaged in volunteer work.

Chapter 16

Underutilization

Bangladesh 2016-17

This chapter presents the survey findings on the unmet need for employment among the working age population in three separate forms, viz. Time-related underemployment, Unemployment and Potential labour force. These measures capture groups of the population that, in one way or another, do not have sufficient access to employment.

Chapter 16

Labour underutilization

16.1 Labour underutilization

Labour underutilization refers to mismatches between labour supply and demand, which translate into an unmet need for employment among the population. Measures of labour underutilization include the following types:

- time-related underemployment**, when the working time of persons in employment is insufficient in relation to alternative employment situations in which they are willing and available to engage; Skills related underutilization is not included here;
- unemployment**, reflecting an active job search by persons not in employment who are available for this form of work;
- potential labour force**, referring to persons not in employment who express an interest in this form of work but for whom existing conditions limit their active job search and/or their availability.

The distribution of the under-utilized working age population by quarter, area and sex for the survey period 2016-17 is provided in table 16.1 below. A total of 6.6 million population aged 15 years or older was underutilized.

Table 16.1: Labour under-utilization of the country, by quarter, sex and area (in '000)

Quarter	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Q1	2067	2500	4567	794	1138	1931	2861	3638	6498
Q2	2426	2210	4636	937	1097	2034	3364	3306	6670
Q3	2270	2371	4641	876	1229	2105	3146	3600	6746
Q4	2288	2042	4330	820	1237	2057	3108	3279	6387
Year	2263	2281	4544	857	1175	2032	3119	3456	6575

It is evident from chart 16.1 that the number of females were more underutilized in all the quarters, both in rural and urban areas. By largest share, there were more females, (3.5 million or) than males (3.1 million) of the working age population.

Table 16.2: Labour under-utilization of the country, by age group sex and area (in '000)

Quarter	Rural			Urban			Bangladesh

Total	5.9	5.9	5.9	5.4	7.3	6.4	5.8	6.3	6.0

As reflected in table 16.2, the largest share of the under-utilized population (65.2 per cent) belongs to the young age group, aged 15-29 years, followed by (34.1 per cent) from the age group 30-64 years and 65+ years (0.7 per cent). Overall, about 6.0 per cent of the working age population were under-utilized during the survey period 2016-17. Between the sexes by largest share, there were more females, (5.8 per cent) than males (6.3 per cent) of the working age population.

Table 16.3: Labour under-utilization as % of WAP, by education attainment, sex and area (in '000)

Education	Number					% of working age population

* PLF=Potential labour force, TRU=Time related underemployment, Unemp=Unemployment

Table 16.3 reflects the distribution of the under-utilized in terms of their education level. Of those who were under-utilized in 2016-17, of them, the highest share 14.2 per cent of the working age population had completed tertiary level of education, followed by 8.1 per cent who had completed secondary or post-secondary non-tertiary level, 4.4 per cent completed primary level and 3.3 per cent had no formal education (Chart 16.2 below).

16.2 Time-related underemployment

Persons in time-related underemployment are defined as all persons in employment who, during a short reference period, wanted to work additional hours, whose working time in all jobs was less than a specified hours threshold, and who were available to work additional hours given an opportunity for more work, where:

- the “working time” concept is hours actually worked or hours usually worked, dependent on the measurement objective (short or long-term situations) and in accordance with the international statistical standards on the topic;
- “additional hours” may be hours in the same job, in an additional job(s) or in a replacement job(s);
- the “hours threshold” is based on the boundary between full-time and part-time employment, on the median or modal values of the hours usually worked of all persons in employment, or on working time norms as specified in relevant legislation or national practice, and set for specific worker groups;
- “available” for additional hours should be established in reference to a set short reference period that reflects the typical length of time required in the national context between leaving one job and starting another.

Of all employed (60.8 million) persons in the country in 2016-17, an estimated 1.5 million persons (2.4 per cent) were underemployed (table 16.4). Of them, 0.93 million were male (2.2 per cent of total male employed) and 0.54 million were female (2.9 per cent of total female employed). And the majority of them lived in rural areas, at 1.14 million persons, compared with 0.33 million persons in urban areas.

16.3 Unemployment

Persons in unemployment are defined as all those of working age who were not in employment, carried out activities to seek employment during a specified recent period and were currently available to take up employment given a job opportunity, where:

- (a) “not in employment” is assessed with respect to the short reference period for the measurement of employment;
- (b) to “seek employment” refers to any activity when carried out, during a specified recent period comprising the last four weeks or one month, for the purpose of finding a job or setting up a business or agricultural undertaking.

Based on the survey findings (table 16.5), an estimated 2.68 million population aged 15 or older were unemployed at the time of the survey. Male accounted for 1.35 million, with 1.33 million females. An estimated 2.1 million or 79.9 per cent of the unemployed population were youths, aged 15-29 years, followed by 20.4 per cent in the age group 30-64 years. Among the youth unemployed persons, the proportion of male (80.2 per cent) was slightly higher than that of female (79.0 per cent) counterparts (Chart 16.3).

Table 16.5: Unemployed population of the country, by age group, sex and area

16.4 Potential labour force (entrants)

Potential labour force is defined as all persons of working age who, during the short reference period, were neither in employment nor in unemployment and: (a) carried out activities to “seek employment”, were not “currently available” but would become available within a short subsequent period established in the light of national circumstances (i.e. *unavailable jobseekers*); or (b) did not carry out activities to “seek employment”, but wanted employment and were “currently available” (i.e. *available potential jobseekers*).

- PLF-Potential labour force, NLF-Not in labour force, WAP-Working age population

As shown in table 16.6, of the 109.1 million persons aged 15 years or older, 45.5 million of them were outside the labour force or not engaged in economic activity and among them 2.4 million or 5.3 per cent were potential labour force (either looking for the job or available for the job). Among the 2.4 million potential labour force of the population who are basically not engaged in any economic activity, almost 1.5 million or 61.3 per cent of the them population was in the younger age groups, 15–29 years old. About one-thirds (37.4 per cent) of the potential labour force was belongs to the adult age group (30-64), whereas only 1.3 per cent of the population from the age group 65+ years old.

16.5 Labour underutilization by type

As mentioned earlier, there are following three types of underutilization viz. **time-related underemployment**, **unemployment**, and **potential labour force**.

Table 16.7: Labour under-utilization, by type, sex and area (in '000)

Type of underutilization	Rural			Urban			Bangladesh		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Unemployed	929	882	1811	417	448	866	1347	1330	2677

Potential labour force	27.1	43.0	35.1	27.1	51.7	41.3	27.1	45.9	37.0
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

*TRU- Time related underemployment

As reflected in table 16.7, number of females (1.59 million) were more than twice than male counterparts (0.85 million) in relation to **potential labour force**- referring to persons not in employment who express an interest in this form of work but for whom existing conditions limit their active job search and/or their availability. Total number of males (0.93 million) were almost twice than females (0.54 million) in case of **time related underemployment**-when the working time of persons in employment is insufficient in relation to alternative employment situations in which they are willing and available to engage; but for the **unemployment**-reflecting an active job search by persons not in employment who are available for this form of work, number of females (1.35 million) and males (1.33 million) were found almost same for the unemployed.

Chapter 17

Labour migration

Bangladesh 2016-17

This chapter presents the survey findings on migrant persons by their reason for moving and current economic activity status for the migrant population. It also illustrated the distribution of migrant population by age group, sex, area and economic activity status.

Chapter 17

Labour migration

This chapter presents the survey findings on migrant persons by their reason for moving and current economic activity status as well as the labour force participation rate, and unemployment rate for the migrant population. Migration is defined as the process of changing residence from one geographical location to another.

17.1 Distribution of migrant and non-migrant persons

The survey questionnaire included questions on place of birth as well as place of previous residence. According to the findings (table 17.1), the estimated percentage of migrants to total population aged 15 or older was 19.3 per cent (2.1 million migrants). It was 39.0 per cent (12.6 million migrants) in the urban areas and 10.1 per cent (8.5 million migrants) in the rural areas. Among the migrants, 6.8 million of them were male (32.3 per cent) and 14.2 million were female (67.7 per cent).

Table 17.2 below indicated the distribution of migrant population by age group, sex and area. By age group, more migrants were found in the 25-29 age group, at 3.5 million persons or 25.5 per cent, with just slightly fewer (24.6 per cent) among those aged 30-34 years; followed by the 20-24 age group, at 2.8 million persons or 21.9 per cent; and 35-39 age group, at 2.7 million persons or 22.2 per cent. The pattern was twice higher for females, with more female migrants in all the age groups. Almost two-fifth of the working age population in the urban areas (12.6 million or 39.3 per cent) were migrant whereas only one-tenth (11.0 per cent) of them were migrant in the rural areas.

About two-fifth of all migrants (40.4 per cent) cited "Marriage" as their reason for changing residence, followed by "Family reason" (29.5 per cent), referring to any family member who had moved to the place of enumeration from a previous residence because the entire family had moved (table 17.3). The third most frequent reason given was "In search of employment/job" (24.3 per cent).

According to the findings on current economic activity or labour force status (table 17.4), most of the migrants were employed, at 53.5 per cent, followed by not in labour force, at 44.4 per cent and only 2.1 per cent for the unemployed persons. By sex, there exists different pattern; 85.8 per cent of the male migrant were employed whereas it was 38.1 per cent for the female migrant. Female migrants were dominated by the not in labour force (59.4 per cent) group, followed by employed group (38.1 per cent) and the rest in the unemployed group, at 2.5 per cent.

As reflected in chart 17.1 and table 17.5, the proportion of migrants were highest in the tertiary education, at 35.4 per cent, followed by Secondary or post-secondary non-tertiary, at 20.8 per cent, some or completed primary, at 18.9 per cent, and only 15.3 per cent for the not formally educated persons. By sex, a clear positive correlation was observed, the higher education level, the higher proportion of migrants.

<i>Table 17.5: Distribution of migrant population, by education attainment, sex and area</i>

The distribution of the migrant population varies widely by locality and division (Table 17.6). In rural areas, the largest proportion of migrant was in Dhaka, at 30.2 per cent, followed by 17.1 per cent in Chittagong, and 15.2 per cent in Khulna division. In both urban and rural areas, the female migrants were much higher than male counterparts. At the national level, female (25.9 per cent) migrant was as double than that of male (12.6 per cent) migrant.

Total	8460	4491	8069	21019	11.0	24.4	59.6	19.3

Chart 17.3 indicated that, highest 59.6 per cent of the working age population aged 15 years or older were found as migrant in the city corporation area, followed by 24.4 per cent at the urban area, and only 11.0 per cent in the rural areas.

17.2 Labour force participation rate of migrants and non-migrants

The estimated migrant labour force participation rate for migrants was higher than non-migrants both for male and female (table 17.8). It was at 87.2 per cent for male migrants and 79.5 per cent for male non-migrants and 40.6 for migrants female and 34.9 for non-migrants females. The highest rate of migrant labour force participation was found among those aged 25-29 years and 30-64 years. In all age groups, the migrant labour force participation rate was higher for both sex than the non-migrants.

Table 17.8: Labour force participation rate of migrants and non-migrants and the difference, by age group and sex

Age group and sex		Migrant	Non-migrant	Difference
		Labour force participation rate (LFPR)		
Total	Male	87.2	79.5	7.6
	Female	40.6	34.9	5.7
18-24	Male	64.4	53.5	10.8
	Female	37.4	22.9	14.5
25-29	Male	95.0	93.8	1.2
	Female	44.3	42.4	1.8
30-64	Male	95.5	94.5	1.0
	Female	42.7	42.1	0.6
65+	Male	47.6	47.1	0.6
	Female	10.1	8.5	1.6

17.3 Unemployment rate of migrants and non-migrants

The unemployment rate for non-migrant was higher than migrants for both male and female, at 3.3 per cent and 6.9 per cent respectively for non-migrants, compared with 1.6 per cent for male and 6.0 per cent for migrants. The highest rate of male migrant unemployment was found among persons aged 18-24 years (5.9 per cent), while the highest rate among females was 11.6 per cent among age group 25-29 (table 17.9 below).

Table 17.9: Unemployment rate of migrants and non-migrants and the difference, by age group and sex

Category		Migrant	Non-migrant	Difference
		Unemployment rate		
Total	Male	1.6	3.3	-1.7
	Female	6.0	6.9	-0.9
18-24	Male	5.9	10.6	-4.7
	Female	11.0	19.8	-8.8
25-29	Male	2.7	6.4	-3.7
	Female	11.6	14.0	-2.4
30-65	Male	0.7	1.0	-0.3
	Female	2.4	2.1	0.2

Annexure-1

Statistical Tables

Bangladesh 2016-17

This Annexure illustrates the detail statistical tables of size and composition of employment, unemployment, underemployment, underutilization and various form of works. Also, it includes the quarterly tables of the structure of the employment and unemployment issues. Tables of Standard Errors (SE) and Confidence limits (CL) of the major estimates is also deals here.

সেকশন ১: খানা সম্পর্কিত তথ্য : আর্থসামাজিক অবস্থা (বাসস্থান, সম্পদ ইত্যাদি)

1 আপনার বসত ঘরের মালিকানা কি?

নিজস্ব	1	
ভাড়া	2	
বিনা ভাড়া	3	

2 বাসস্থানের প্রকার

একক	1	
এপার্টমেন্ট	2	
সংযুক্ত	3	

3 খানার বসত ঘরে দেয়াল নির্মানের উপকরণ কি?

খড় / বাঁশ / পলিথিন / প্লাস্টিক	1	
মাটি	2	
টিন	3	
কাঠ	4	
ইট / সিমেন্ট	5	
অন্যান্য	9	

4 খানার বসত ঘরের ছাদ নির্মানের উপকরণ কি?

খড় / বাঁশ / পলিথিন / প্লাস্টিক	1	
টিন	2	
টালি	3	
ইট / সিমেন্ট	4	
অন্যান্য	9	

5 খানার বসত ঘরের মেঝে নির্মানের উপকরণ কি?

মাটি	1	
কাঠ / বাঁশ	2	
ইট / সিমেন্ট	3	
মোজাইক / টাইলস	4	
অন্যান্য	9

7 আপনার খানার খাবার পানির প্রধান উৎস কি?

ঢ্যাপ	1	
নলকূপ / গভীর নলকূপ	2	
কূপ	3	
পুকুর	4	
নদী / খাল / খন্দ	5	
অন্যান্য	9	

8 এই খানায় কি ফুটানো / বোতলজাত / ফিল্টার পানি পান করা হয়?

হ্যাঁ	1	
না	2	

9 আলোর প্রধান উৎস কি?

বিদ্যুৎ	1	
সৌর বিদ্যুৎ	2	
কেরোসিন	3	
বায়োগ্যাস	4	
অন্যান্য	9	

10 রান্নার কাজে ব্যবহৃত জ্বালানীর প্রধান উৎস কি?

কাঠ/জ্বালানী কাঠ	1	
গোবর/পাতা/খড়	2	
গ্যাস/ এল পি গ্যাস	3	
বায়োগ্যাস	4	
কেরোসিন	5	
বিদ্যুৎ	6	
অন্যান্য	9	

11 পায়খানা সুবিধা কি ধরনের?

স্যানিটারি (পানি - রোধক)	1	
পিট পায়খানা	2	
কাঁচা পায়খানা	3	
খোলা জায়গা/পায়খানা নেই	4	

12 আপনার খানার আয়ের প্রধান উৎস কি?

কৃষি	1	
শিল্প	2	
সেবা	3	
আয় গ্রহণকারী	4	
রেমিটেন্স	5	
অন্যান্য	9	

13 খানার সদস্যদের মালিকানাধীন মোট জমির পরিমাণ কত?

কোন জমি নেই	0	
০.০১ - ০.০৪ একর	1	
০.০৫ - ২.৪৯ একর	2	
২.৫০ - ৭.৪৯ একর	3	
৭.৫ এবং অধিক	4	

14 এই খানাতে নিম্নোক্ত কি কি সম্পদ রয়েছে? প্রযোজ্য উত্তর সমূহে ক্রস চিহ্ন (x) দিন

14a	আলমারি/ ওয়ারড্রব	
14b	সেলাই মেশিন	
14c	মাইক্রোওয়েভ ওভেন	
14d	ফ্রীজ / ডিপ ফ্রীজ	
14e	ঠেলা গাড়ি / রিক্সা / রিক্সা ভ্যান	
14f	বাইসাইকেল	
14g	মোটরসাইকেল	
14h	৩ চাকার মোটর গাড়ি/ ইজিবাইক	
14i	৪ অথবা তার বেশি চাকার যানবাহন	
14j	নৌকা / ইঞ্জিন চালিত নৌকা	
14k	ইলেকট্রিক ফ্যান	
14l	মোবাইল	
14m	টেলিফোন (ল্যান্ডফোন)	
14n	টেলিভিশন	
14o	কম্পিউটার (ডেস্কটপ, ল্যাপটপ, ট্যাবলেট)	

সেকশন ২: খানা তালিকা

খানার সকল সদস্য

ক্রমিক নম্বর	বয়স	15 খানার সকল সদস্যের তালিকা	16 খানা প্রধান এর সাথে সম্পর্ক		17 লিঙ্গ	18 বয়স	19 ধর্ম	20 বর্তমান বৈবাহিক অবস্থা
		সাধারণত যারা একই বাড়িতে এক সাথে থাকে এবং খাবার খায় সে সাথে গৃহস্থালি আয়োজন ভাগ করে নেয় সে সব সকল সদস্য। কোনো কারণে ৬ মাসের কম সময়ের জন্য কোনো ব্যক্তি খানায় অনুপস্থিত থাকলে তাকেও খানার সদস্য হিসেবে বিবেচনা করতে হবে। অতিথি এবং আগন্তুকদেরকে খানার সদস্য হিসেবে বিবেচনা করা যাবে না। সর্বপ্রথম খানা প্রধানের নাম, তারপর খানা প্রধানের স্ত্রী/স্বামীর নাম, তারপর সর্বকনিষ্ঠ পুত্র/কন্যার নাম, এরপর জ্যেষ্ঠতম পুত্র/কন্যার নাম, এরপর পুত্র/কন্যার স্ত্রী/স্বামী ও সন্তানের নাম (ছোট থেকে বড়), এরপর পিতা/মাতা, তারপর ভাই/বোন, শ্বশুর/শাশুড়ি, অবশেষে অন্যান্য আত্মীয় স্বজন, গৃহপরিচারক/গৃহপরিচারিকার নাম ও অন্যান্যদের নাম। পুরো নাম	খানা প্রধান 1 স্ত্রী/স্বামী 2 পুত্র/কন্যা 3 মা/ বাবা/ শ্বশুর/ শাশুড়ি 4 ভাই/বোন 5	গৃহকর্মী 6 আত্মীয়-স্বজন 7 অনাত্মীয় 9	পুরুষ 1 মহিলা 2	(পূর্ণ বছর) যদি বয়স <1 00 লিখুন বয়স ≥99 99 লিখুন	ইসলাম 1 হিন্দু 2 বৌদ্ধ 3 খ্রীষ্টান 4 অন্যান্য 9	বর্তমান বৈবাহিক অবস্থা শুধু মাত্র ≥১০ বছর বয়সীদের জন্য অবিবাহিত 1 বিবাহিত 2 বিধবা/ বিপত্নীক 3 আলাদা 4 তালাকপ্রাপ্ত 5
